Underdeveloped countries are predominantly agricultural countries, and "subsistance" agriculture is widespread In subsistance agriculture, the primary object is to produce the food for your own family Primitive tools and techniques of cultivation are used, and the margin between what can be produced and what is required to support life is narrow the failure of crops because of drought, or the destruction of crops by floods, can lead to famine unless food is quickly supplied from outside the area affected Because the margin is so narrow, the surplus from the agricultural sectors which can be exchanged for the products of other sectors is small—which is another way of saying that the demand for the goods and services produced by other sectors—e g, industry or transport--is low There is a vicious circle in which low productivity is both a cause and an effect of low incomes The problem of development has become peculiarly urgent because of the rapid growth of population in underdeveloped countries Typically, these countries have had a high birth rate and a high death rate With the application of modern methods of disease control --e g, the control of malaria through DDT spraying—death rates have tended to fall, while birth rates have remained high In consequence, some countries are experiencing a very rapid expansion of population rates of increase of 3 per cent, involving a doubling of population in as little as 24 years, have been recorded. The pressure of population on the land has therefore increased Less productive land has had to be brought into cultivation, and erosion and loss of fertility have become major problems A substantial increase in output is required to prevent a fall in per capita income as population grows, and an even greater increase is required if living standards are to be improved.

This is an immense problem, and one which most underdeveloped countries will not be able to solve without generous help from developed countries There are usually considerable potentialities for increasing agricultural output· but before such increases can be achieved new skills have to be mastered and different techniques of

production introduced. Schemes of irrigation and flood control, for example, can increase production: but they require heavy investment, and different crops and cropping patterns may have to be introduced if the fullest benefit is to be derived from such schemes In most countries, too, alternative employment in industry or services has to be created to reduce pressure on land resources, and to meet the demands which higher incomes will generate Nearly all underdeveloped countries now have development plans but only a combined and sustained effort by developed and underdeveloped countries can ensure that the plans are successful.

Aid to Underdeveloped Countries.

One form of financial assistance to underdeveloped countries—the loans of the International Bank—has already been mentioned Another source of funds is investment by individuals and firms from developed countries. These investments—setting up branch factories, for example—tend to be in projects which offer relatively bright prospects of profit to the investor Prospects in the least developed countries are often not sufficiently attractive for the private investor. most of the UK private investment overseas, for example, has been concentrated in the relatively highly developed countries of the sterling area Nonetheless, some underdeveloped countries such as India have attracted a significant amount of private investment.

Quite the most important source of financial aid to underdeveloped countries has been the loans and grants made by the Governments of developed countries The contribution of the U.S A has been preponderant, though Britain and France have been important sources of aid for sterling and franc area countries respectively Figures prepared by the United Nations show that grants and loans from the Governments of developed countries to underdeveloped countries averaged nearly $3 billion (over £1,000 million) per annum in the years 1958 and 1959, and that this aid had increased rapidly during the 1950s Government aid can take many forms Specific projects can be financed, or aid can take a more general form in financing some of the expenditure by the Governments of underdeveloped countries All financial aid provides foreign currencies to underdeveloped countries, and enables them to buy more imports than would otherwise have been possible. This is particularly important, because countries in the process of development are commonly faced with rapidly rising import bills. Machinery and other capital equipment has to be imported, and often there are increased imports of food and consumer goods as incomes rise. If the underdeveloped countries could only buy the goods which could be paid for by receipts from their exports, development would be seriously hindered. An innovation at the end of the 1950s was the scheme in which Britain, the U S.A., and certain other countries undertook to ensure that sufficient foreign currency was available to finance the completion of India's Second Five-Year Plan. It is to be hoped that co-operative schemes of this sort will be an increasingly important feature of aid on a generous scale to under developed countries. For it is certain that the level of financial aid will have to be increased if there is to be a sustained improvement in the standard of living of these nations.

Yet financial aid alone is not enough. Most underdeveloped countries need help and advice on planning their development, to ensure that development possibilities are exploited and that scarce resources are used to best advantage. Hence the many schemes for sending out experts—by the technical agencies of the United Nations, such as the Food and Agriculture Organisation, the World Health Organisation, the International Labour Organisation, the Technical Assistance Bureau, and the United Nations Educational, Scientific, and Cultural Organisation (UNESCO); by the International Bank; and by individual countries, notably by the U.S.A. under its Point Four programme. Hence also the schemes for educating and training people from the under developed countries in universities and colleges in the developed countries, one of the main strands of the Colombo Plan, the Commonwealth's own scheme for help to the poorer members in South-East Asia The list could go on, but what is being done is still far below the need.

Finally, mention must be made of an important responsibility of developed countries, which is too often overlooked The eventual objective must be to put developing countries into such a position that they can manage without aid This means that those countries must be able to pay for their imports with their exports. The exports of underdeveloped countries at present consist largely of primary products—food and raw materials The prices of most of these products fluctuated considerably in the 1950s, but the general trend was of falling prices for most of the decade after 1951 This was an important cause of the improvement in Britain's terms of trade (*see* G7 (1)), because Britain is a large importer of primary products The reverse side of the coin was a deterioration in the terms of trade of many underdeveloped countries, who were able to buy fewer imports for a given quantity of exports A strong case can be made for a policy on the part of developed nations designed to ensure a greater stability of prices for food and raw material exports from underdeveloped countries Moreover, developed countries must not act in such a way as to hinder a growth of exports from developing countries. These countries will need to increase their exports of food, raw materials, and simple industrial products from their new industries To the extent that developed countries adopt a dog-in-the-manger attitude to protect their own agriculture and industry, developing countries will be severely hindered and the developed countries will not benefit so markedly from the rapid growth of markets for the more advanced industrial products as the wealth of all nations increases.

2. EMPLOYMENT, PRODUCTION, AND INVESTMENT.

Population.

In June 1959 the population of the United Kingdom was estimated to be 52·0 million—45·4 million in England and Wales, 5·2 million in Scotland, and 1·4 million in Northern Ireland The total was still rising slowly, at a rate of about 1 per cent every five years Prediction of future trends is difficult Before the war it was common to predict that Britain's population would fall later in the century; but these predictions were made during the depression of the 'thirties, when the birth-rate was very low. Since then the birth-rate has risen sharply, and the net reproduction rate (the ratio of the birth-rate of girls less their infant mortality to the population of women of child-bearing age) has been above unity in most years since the war. But for the high birth-rate there are possible special explanations, the most important being the rapidly falling age of marriage, which makes it difficult to say whether the high birth-rate will be maintained. In the near future population will certainly continue to rise slowly as improving medical services raise the average length of life, which is now 71 years, as against 61 years in 1930–32, and as the gap between generations shortens. But whether in the long run—after A D. 1980, say—the population will continue to rise, nobody now can predict with confidence.

The Population of Working Age.

Of the total population, only some are of working age. Working age is defined as the period between the minimum school-leaving age of 15 and retiring age—65 for men and 60 for women. Of course, not all those of working age do work—some are invalids, some are still at school—and not all those above retiring age have retired, but nevertheless the ratio between the population of working age and the total is a useful statistic, as it does provide a rough guide to the numbers who have to be supported out of the current national income, but who do not contribute to it. This ratio is rising, and will continue to rise. In 1954, 22½ per cent of the population was below working age and 14 per cent above. By 1978 it is fairly certain that 17½ per cent of the population will be above working age; and, much more speculatively, it is guessed that 22½ per cent will be below. So the population not of working age will rise from

POPULATION BY AGE-GROUPS, 1959.
(Millions)

Ages	Males	Females	As proportion of totals. Actual. 1954	1959	Estimated 1978.	1998

Total	2·35	5·19				
Total	25·24	26·92	100	100	100	100

36½ to 40 per cent, which means that for each person of working age there will be 0·67 other persons, as against 0·58 in 1954. More hypothetical projections beyond 1978 suggest that the ratio will then fall slightly, unless advances in medical science lead to a major prolonging of life in *old age*. To date their main contribution has been to cut down deaths at earlier ages, and particularly in the years of infancy. The expected growth in the proportion of the old explains why the cost of pensions (see **G32**) is going to grow steadily. more generally, it is clear that some growth in output per head of the population of working age will be needed to meet the needs of the increasing proportion of dependants. A move to increase the school-leaving age to 16—or indeed to 18, as some think it should be increased—would, of course, still further raise the proportion of dependants.

The Working Population.

Not all persons of working age actually work, although the vast majority do, but only a part are gainfully employed, *i.e.*, work for wages, salaries, or profits. And it is only those who are gainfully employed who are counted in the working population. Housewives, mothers, and those who give their services gratis to good causes are not included, unless they also do some work for cash. In 1959, when the total population of Great Britain was 52 million, of whom 32½ million were of working age, the total working population (including the unemployed who were seeking employment) was only 24½ million. Of the 16 million women of working age, only 8 million were gainfully employed. So for every gainfully occupied person there was just over one other person to be supported out of the goods and services they provided.

One feature of the post-war years, until the recession of 1958, was a steady increase in the proportion of persons going out to work. Between 1948 and 1958 this factor added well over half a million persons to the working population. Such an increase is unlikely to continue in the future, and one has to expect that in the future increased output will have to come from increased productivity, and not, as it did to some extent in recent years, from an increase in the proportion of people who work.

Most of the working population work for wages

DISTRIBUTION OF WORKING POPULATION, JUNE 1958
(Thousands)

Basic industries		Manufacturing industries		Services	
Agriculture and fishing	1,090	Chemicals and allied trades	538	Distribution	3,000
Mining and quarrying	858	Bricks, pottery, glass	329	Insurance, banking, and finance	523
Building and contracting	1,528	Metal manufacture	562	Professional	1,985
Gas, electricity, and water	382	Engineering and other metal goods	3,946	Public administration	
Transport and communication	1,733	Textiles, leather, and clothing	1,671	National	550
		Food, drink, and tobacco	954	Local	784
		Paper and printing	591	Miscellaneous	1,827
		Furniture and other wooden goods	309		
		Other manufacturing	447		
Total	5,591	Total	9,347	**Total**	8,669
As percentage	*23*		*40*		*37*

or salaries as employees. Of the total in June 1958 of 24·0 million, over 2½ million were employers or self-employed, over ½ million were in the Forces, and 22·3 million were either employees or unemployed persons looking for work The table shows the industries where people work. About two-fifths of the total work in manufacturing industry, nearly 4 million of them in the engineering and allied industries. A quarter work in the basic industries, and the remaining 37 per cent work in the so-called service industries—3 million in distribution, 2 million in the professional services (¾ million each in education and in the health services).

Employment and Unemployment.

In June 1960, 305,000 persons—1·4 per cent of the working population—were unemployed Even in January 1959, the worst month since the war—apart from a brief period during the fuel crisis of 1947, when coal shortage forced widespread closure of factories—the rate rose only to 2·8 per cent, and in most years in the 'fifties the average was lower than 1½ per cent This contrasts with an average figure in 1937, the best year of the 'thirties, of 11 per cent, and with a figure of 22 per cent at the bottom of the slump in 1932. Probably 1–1½ per cent is somewhere near the practicable minimum, for some unemployment is more or less inevitable Some seasonal rise in unemployment in the winter must be expected, e g in seaside towns, and for this reason unemployment in January is about ½ per cent higher than in June. Moreover some unemployment is bound to be involved in job-changing and as the demands of industries change What full employment means is not no unemployment, but rather that there should be about as many jobs vacant as there are workers looking for jobs A large excess of vacancies, such as occurred in 1951 and 1955, is evidence of inflation, for it means that some factories which need workers to fulfil the demands for their output cannot get them

To some extent unemployment figures are misleading, as not all unemployed workers are eligible for unemployment benefit under the National Insurance Scheme Most married women who go out to work normally opt not to pay the full National Insurance contributions, so that, when they lose their jobs, they just drop out of the figures for the working population unless they choose to register for work Between June 1957 and January 1959, the worst point of the recession of 1958–59, unemployment rose by 368,000, from 250,000 to 618,000, but in the same period the numbers in employment fell by as much as 591,000 Thus unemployment figures definitely understate the seriousness of recessions, as they do not count all the persons who would like to have, but cannot find, jobs

UNEMPLOYMENT AND VACANCIES
(Annual averages for Great Britain, thousands)

	Un-employ-ment	Vacancies	Unemploy-ment as percentage of total employees.
1932*	2,829	n a.	*22·1*
1937*	1,482	n a	*10·9*
1951	253	410	*1·2*
1952	414	275	*2·0*
1953	342	274	*1·6*
1954	285	329	*1·3*
1955	232	405	*1·1*
1956	257	357	*1·2*
1957	313	276	*1·4*
1958	457	198	*2·1*
1959	475	223	*2·2*
1960	360	314	*1 6*

* Figures relate only to population insured against unemployment.

Of the 475,000 persons unemployed in 1959, 344,000 were men and 131,000 were women Of the men over half, 183,000, had been unemployed for over eight weeks, 75,000 between two and eight weeks, and 85,000 under two weeks Thus long-term unemployment was about 1 per cent of the total labour force, serious enough for those affected, but not the kind of unemployment to be cured easily by reflationary measures.

Regional Unemployment.

One peculiarly dreadful feature of the inter-war years was the depressed areas—the regions of the country where a third of the men had not had a job for a year or more. Such extreme regional unemployment has not recurred since 1945, only in Northern Ireland was unemployment very high in the 1950s In 1956, the best year since 1950, unemployment there averaged 6 4 per cent, and in 1958 it rose to 9·3 per cent on average. Nevertheless, it was disquieting that in the recession of 1958–59 unemployment did rise rather more sharply in the old depressed areas of the North-East, Scotland, and Wales These areas are particularly dependent on the heavy industries of mining, steel, and shipbuilding, and there are unwelcome signs of a re-emergence there of depressed conditions, though on nothing like the pre-war scale.

REGIONAL UNEMPLOYMENT
(Percentage unemployed)

	In January 1959	In July 1960
Great Britain	2·8	1·3
Midlands	2·2	0·6
London and South-east	1·7	0·7
North Midlands	2·1	0·8
East and West Ridings (Yorkshire)	2·7	0·9
Eastern and Southern	2·1	0·9
South-western	2·9	1·2
Lancashire and Cheshire	3·6	1·7
North-east and North	3·9	2·3
Wales	4·6	2·1
Scotland	5·4	3·2
Northern Ireland	9·7	6·0

In 1959 the Government passed the Local Employment Act, a measure to give the Board of Trade powers to induce industry to go to the areas where unemployment shows a tendency to be permanently high. This Act does not cover Northern Ireland, which is the responsibility of the Northern Ireland Government Under the Act some progress has been made, for instance, some motor-car manufacturers have agreed in bargains with the Board of Trade to put some of their new factories in the areas with relatively high unemployment But, in general, it has proved difficult to persuade firms to set up new factories in Wales, Scotland, or the North-East, and even more difficult to persuade them to go to places like Falmouth, where there are isolated pockets of unemployment But, unless the policy is fully successful, we shall continue to have the position whereby checks have to be placed on the economy before full employment is reached, because in the booming areas of London and the West Midlands vacancies far exceed unemployment

Production and Productivity.

It is fairly easy to measure output in the main manufacturing industries, and in many of the basic industries It is much more difficult to do so in the service industries, the output of a doctor or a shopkeeper is not easily measured So each month the Central Statistical Office calculates an Index of Industrial Production covering the main productive industries; estimates for changes in the output of service industries are made only once a year. This tends to give a false impression of the rate of growth of output, since the productive industries—particularly manufacturing industries—are the ones best placed to raise their output per head. Much more than a doubling of the index of industrial production is needed to double the standard of living, and roughly a 5 per cent in-

crease in industrial output is likely to be accompanied by a 3 per cent increase in the total output—or national product—on which the average standard of living depends

Between 1948 and 1959 total output rose by 32 per cent. Up to 1954 the average rate of growth was nearly 3 per cent per year; but after that year it dropped to less than 2½ per cent Employment also rose, so the increase in output per head was rather lower—only 26 per cent between 1948 and 1959 Also, up to about 1954, the average working week was getting longer, in spite of cuts in the official working week If in future years the average working week becomes shorter, the same rate of increase in output will require a rather higher rate of increase in output per hour worked.

cars, tractors, commercial vehicles, and aircraft. Paper and printing is another fast-growing industry, with general and electrical engineering not far behind At the other end of the scale are textiles and shipbuilding, two industries which were in continuous difficulties between the wars, and continue to be so, as they lose their export markets to cheaper competitors. The timber and furniture industry did not increase its output after 1954, mainly because additional expenditure on goods for the home was concentrated on electrical equipment

As with industries as a whole, so within manufacturing industries, growth in productivity tends to be fastest where growth in demand is greatest. The industries where output stagnated are the ones where productivity also stagnated—notably

CHANGES IN OUTPUT AND EMPLOYMENT BY INDUSTRY, 1948–59
(1959 as percentage of 1948)

	Proportion of total output in 1954	Output	Employment	Output per head *
Agriculture, etc	5	132	84	157
Mining	4	101	94	107
Manufacturing	37	148	112	132
Building	6	128	104	123
Gas, electricity, and water	2	178	116	153
Transport and communication	8	122	94	130
Distribution	13	137	121	113
Insurance, banking, and finance	6	147	119	124
Professional services	7	142	135	105
Miscellaneous services	7	110	86	128
Public administration and defence	6	89	86	104
Total	100	132	105	126

* These figures are approximate, and in respect of service industries, should be taken as only rough guides.

The fastest-growing group was that of the public utilities, including the electricity industry Next came manufacturing and finance, closely followed by the professional services—largely education and health At the other end of the scale are miscellaneous services, which include the declining cinema industry and domestic service, mining; and public administration and defence The last two are also ones with very slowly rising productivity, and in general there is some relation between growing output and growing productivity—the notable exception being agriculture, in which a sharp rise in output went with a sharp fall in employment, as farms became increasingly mechanised

Within manufacturing industry two industries have set the pace—chemicals, which includes drugs, plastics, cosmetics, detergents, and oil refining, and vehicles, which includes, besides motor

in shipbuilding and textiles This fairly general rule is one reason why it is so unfortunate if restrictions have, for balance-of-payments reasons, constantly to be placed on demand—and particularly on demand for goods such as cars and washing machines, of which so many are bought on hire purchase, for the restraints tend to hinder the expansion of fast-growing industries Manufacturers become less eager to take the risks of buying new, more productive equipment, and the growth of productivity, on which the future standard of living depends, tends to slow down

Foreign Comparisons.

Between 1953 and 1959 British manufacturing output rose by 24 per cent This was a greater expansion than that of the U S A., but it was smaller than that of any West European country

Note. Figures in brackets refer to the proportionate importance in total output in 1954.

other than Sweden. In the three large members of the Common Market, output went up by 60 per cent or more In Russia and in Japan the rate of growth was still faster, output nearly doubling in six years. Although there are good reasons for not accepting the Russian figures at their face value—a value which would imply that, while Britain added a half to her output, Russia in the same period 1948–59 quadrupled it—the contrast is broadly correct. A similar contrast between West European countries and Britain is found for the volume of exports, which suggests a link between output growth and export performance

This phenomenon of slow growth is not new in Britain. It was there between the wars, and even before the First World War So probably the causes lie in rather fundamental aspects of British industrial organisation Probably Britain is still the second most productive large industrial nation—international comparisons of productivity cannot easily be made But it is a fast diminishing lead, and it is not one that gives Britain any edge in the competition for foreign markets, since British standards of living are also higher than those of our main European competitors

Capital and Automation.

Many of the growing industries are capital-intensive they use much machinery and equipment per unit of output produced In chemicals, steel, and, above all, electricity, the plant is extremely expensive Most of the innovations since the war—nylon, atomic power, terylene, polythene, etc.—require a high capital investment, and cannot pay unless they are worked nearly full-out One way to achieve this is by shift work, and it may be that a full exploitation of the potentialities of these new industries will require a great extension of this system of work And the future holds out prospects of still more intensive requirements for capital as automation spreads With automation, much of the manual semi-skilled work should come to an end The new electronic computers will be able to control the machines that actually do the manufacturing operations "Transfer" machines have been developed to pass a component from one machine to another Control machines can read details of the work to be done off a piece of tape, they can start and stop machines at the right point, they can adjust themselves to correct mistakes or to adjust for faulty materials

So far the impact of automation has been small The main use has been in the office, where electronic computers can carry out far more efficiently much of the routine calculating, recording, and checking operations previously done by clerks. But it will continue to spread, and must do so if the growth in wealth is to continue. The change will come only gradually. But ultimately one can envisage that both in manufacturing industry and in office work the machine will have replaced much of the human effort in work, and even more of its drudgery The typical manual job will become that of the skilled maintenance man

This revolution will take many decades to effect It raises no spectre of widespread redundancy; but it does mean that over the years more and more emphasis will need to be laid on the training of workers for skilled work, and indeed on raising the general level of education Also over the years the average size of factory is likely to grow, as these new methods, if they are to be profitable, have to be used on a large scale. Finally, the prospect is for ever-increasing requirements of capital—and of course for the savings to finance it.

Monopoly and Competition.

This trend to increasing size and increasing capitalisation has been going on now for many decades, and in the process it has changed the face of British industry In the early nineteenth century the typical firm was the owner-managed textile mill Then in the 1860s and 1870s came the discovery of cheap methods of making steel, with the consequential immense growth in the engineering industries Most of the chemical industry is still newer—some very new—and in these capital-intensive industries the big firm predominates In some it has become almost a monopoly no small firm can easily challenge industrial giants like Imperial Chemical Industries, the Dunlop Rubber Company, or Unilever In others the pattern is of a few firms, all large, as in motor cars, detergents, and steel. Competition goes on, but it has changed its form In the old days competition was largely by price Now it is largely by advertising and by variations in the quality and other features of the product—detergents and motor cars being good examples And in many industries groups of firms producing similar products entered into agreements which had the effect of restricting competition, for example through schemes for price-fixing

The passage of the Restrictive Practices Act in 1956 outlawed many of the main forms of restrictive agreements to prevent competition Collective price-fixing was declared to be illegal unless the industry could show that the practice brought substantial benefit to the public Collective price-fixing is the system under which a central associa

tion for the industry lays down minimum prices at which members may sell. Usually such a system was backed by arrangements for collective boycotts, under which members of the association would refuse to sell goods to wholesalers or retailers who broke the rules. Often the wholesalers too were in the scheme, and they would collectively refuse to buy from manufacturers who broke the rules. Collective boycotts were also found in industries without collective price-fixing, one common purpose being to make sure that retailers did not sell a manufacturer's products below his recommended price. This form of collective resale price maintenance was also outlawed by the Act. The Act did however permit the individual manufacturer to enforce resale price maintenance for his own products by securing a court order prohibiting price-cutting by retailers.

The Working of the Restrictive Practices Act.

Under the Act any restrictive agreements of several specified kinds had to be registered with the Registrar of Restrictive Practices. He then had to decide whether there was a *prima facie* case for the discontinuation of the agreement, and, if he thought there was, the case was referred to a new Restrictive Practices Court, containing both judicial and lay members. The first case was one against the Chemists' Federation, and they were ordered to abolish the rule whereby sales of certain proprietary drugs were to be made only to pharmaceutical chemists whose names were on a certain list. As a result, these drugs, which are not those for which prescriptions are needed, can be sold in other than chemists' shops. The second case was a most important one as a precedent. The Master Spinners were ordered to abolish their system of collective price-fixing for spun yarn. The case was decided this way, even though the Court felt that it had been established that marked local unemployment would be caused in a few cotton-spinning towns. This was ruled not to outweigh the general gains of the public from increased competition bringing lower prices. The defendants in several other cases brought before the Court failed to justify their agreements as being in the public interest. As a result of these adverse verdicts, a number of industries decided to abandon their existing agreements without defending them before the Court. By mid-1960 only two favourable verdicts had been given—the first in favour of a complicated scheme for sharing export markets for water-tube boilers, and the second in favour of a price-fixing agreement among the black nut and bolt makers.

In general, the Court has been tougher than anticipated, but it is still too early to assess the significance of the new law on the degree of competition in British industry. It leaves untouched the industries where one firm is dominant; these remain the responsibility of the Monopolies Commission, who report on industries referred to them by the Board of Trade, and make recommendations after investigation. Some trade associations have come up with a form of agreement for exchanging information about prices. Such an agreement is not registrable, even though its most likely purpose is to encourage manufacturers to observe a common price policy. But there have been definite signs of increased competition. In 1958–59 many shops began to sell products below their manufacturer's recommended prices, and few manufacturers chose to enforce their rights of compulsory resale price maintenance through the courts. And some expect that, as self-service shops become commoner, the practice will spread. Competition from abroad has also increased sharply; the abolition in 1960 of the last restrictions on American imports brought a sharp challenge from there.

Nationalised Industries.

Nationalised industry accounts for about 20 per cent of British industry. Local authorities also run some services—largely in bus transport and water provision. With the exception of coal-mining, all these industries are natural monopolies in which the provision of competing services would be obviously wasteful. They are thus obvious candidates for nationalisation. With the exception of the brief episode of steel nationalisation in 1951–53, nationalisation has not been extended into manufacturing industry, not even where the existence of a private monopoly might suggest that there was a strong case. But nationalised industries are not free from competition. The railways face competition from road transport, some publicly and some privately owned, the fuel industries compete with each other, and with the privately owned oil industry.

Nationalised industries are supposed to earn enough to cover their costs. In the first ten years the two airways corporations were granted subsidies, but these have now ceased. Costs for a nationalised industry include interest payments on capital—both on the compensation paid to the previous owners and on the rather larger amounts of capital raised since nationalisation. The electricity boards, and to a lesser extent the gas boards, earn something above their costs to finance expansion, but not even then on the scale which is normal practice in private industries. The National Coal Board had accumulated a deficit of £57 million by 1960: the increases in coal prices had not covered the increased costs of mining and distributing the coal. The British Transport Commission, which owns the railways, and supervises the running of London Transport, British Road Services, the canals, many provincial bus companies, and some port authorities, is in chronic deficit. In 1957 it was granted special dispensation to incur a deficit to be charged to capital account on the specious grounds that this was a temporary move pending the full-scale implementation of a £1,200 million modernisation scheme for the railways. In 1960 the deficit of £78 million, which is paid by the Treasury, was recognised for what it was, a subsidy, and was treated for the first time as a current charge against the Government.

Capital Requirements of Nationalised Industries.

The nationalised industries are voracious users of capital, as they are nearly all highly capitalised industries. Until 1956 they raised new capital, when they wanted it, by floating an issue on the Stock Exchange, the issue being guaranteed by the Government. In 1956 the Chancellor of the Exchequer decided to end this system, which made it more difficult to exercise control over the volume of credit, and substitute one in which the nationalised industries draw directly on the Exchequer for their capital. This sytem has been attacked from both sides. The advocates of private enterprise have pointed to the strain this puts on the Exchequer, and to the unfairness whereby the nationalised industries get their capital cheaper or more easily than private industry. A private firm raising a loan would have to pay about ½ per cent more per annum in interest, and it has been recommended that nationalised industries should be forced to borrow on the strength of their own credit. Both the coal-mines and the railways would have the gravest difficulty in raising any capital; but the others could.

From the other side, it has been pointed out that the nationalised industries have suffered from their dependence on the Exchequer. Investment in them was held back in the 'forties and early 'fifties by government fiat. No private industry has had to face the restrictions put on the railways, or even more on the Post Office, the only nationalised industry run by a Government Department and not by a public corporation. And in most balance-of-payments crises the nationalised industries have been forced by the Government to cut back their planned programmes, sometimes at a serious cost in disorganisation. And, whatever new arrangements might be made for financing the capital programmes, it is certain that capital requirements will continue to be very substantial.

Investment.

In 1959 gross investment in capital assets amounted to £3,673 million. This is about 17½ per cent of the gross national product, which is a measure of the total value of the goods and services produced by the nation. In other words, about one part in 6 of total production was used to replace old assets or to add to the nation's stock of capital equipment. The addition to the

stock of capital assets (net investment) accounts for under one half of gross investment· the remainder (about 8 per cent of total output) was needed to offset the wastage of assets already in use. In several other developed countries, a rather higher proportion of output was devoted to investment: in West Germany the proportion of gross investment was 22 per cent

Since the future rate of growth of the economy, and our ability to remain competitive in export markets, is in part dependent upon the proportion of output devoted to investment, it must be a cause for concern if our proportion is lower than that achieved by other developed countries But some progress was made. The proportion of output invested—and, in particular, the proportion of output which was used to enlarge the stock capital assets—was higher in the late 1950s than in the early 1950s This implies, of course, that the proportion of total output going to some other uses fell after 1952, there was a sharp fall in the proportion of output used for military defence

Types of Investment.

The next table shows what investment consists of. The usual classification is into four groups—plant and machinery, the products of the heavy engineering industry, vehicles (motor cars, lorries, ships, locomotives, etc), also produced by the engineering industry, houses and flats, and other construction work, both falling on the building and contracting industry In 1959 investment was split roughly half and half between engineering and building and contracting, although, as plant and vehicles wear out much more quickly, the proportions for net investment were different—40 60 In 1954 the composition of investment was rather different House-building was then much more important, and other types of construction work (roads, railway works, factories, shops, schools) much less important This last kind of investment is much longer-term than other kinds, and its steady growth does show the extent to which Britain neglected to bring her basic assets up to date during and for many years after the war.

KINDS OF INVESTMENT IN 1959
(£ million)

	Gross expenditure	Wastage	Net addition to assets
Plant and machinery	1,304	811	493
Vehicles .	611	402	209
Houses .	646	264	382
Other construction	1,112	474	638
Total .	3,673	1,951	1,722

More interesting, though more difficult, is an analysis of investment by purpose Only a quarter of total investment is undertaken by manufacturing industry to maintain and improve its equipment, and, even if the other main productive industries (mining, agriculture, and building) are included, the proportion is still under a third, and is not much more than the requirements of transport and distribution Even the chemical industry—the most highly capitalised of all manufacturing industries—requires much less capital than the railways The public utilities—here widely defined—require 16 per cent of total investment, more than half of it for the electricity industry; and finally, social investment in housing, schools, hospitals, etc , takes less than a quarter of the total

The predominance of transport is recent The railway modernisation plans and the quintupled road-building programme combined to raise investment in transport assets by no less than 61 per cent between 1954 and 1959 Distribution—another area in which investment had tended to lag behind—rose by 30 per cent, as shop building and rebuilding increased Social investment, on the other hand, fell off School and hospital building went up, but public housing fell off sharply, mainly as a result of the abolition of general housing subsidies Subsidies from the Government to local authorities for new housing were confined to houses built in connection with slum clearance schemes

The Finance of Investment.

Any business is allowed to charge as a cost the depreciation of its assets Normal depreciation allowances are based on the original cost of the asset and on its expected useful life. In a time of price inflation depreciation allowances will not provide sufficient finance to permit the replacement of assets at higher prices, and there are many supporters of depreciation allowances being based on replacement costs Many firms do set aside extra funds specifically to cover these extra replacement costs However, an official committee

of enquiry recommended against a change in practice, and with prices rising less rapidly the issue became less important

Governments have, however, adopted certain fiscal devices to encourage replacement and investment. Soon after the war initial allowances were introduced. Under this system firms were permitted to charge against profits in the first year of its life 20, or at times 40, per cent of the cost of any new equipment, and the system amounted to a loan of the tax saved in the first year, repaid over the life of the asset. This system was withdrawn in 1951, but was later reintroduced. It is still operative for ships; but for machinery it has been replaced by the system of investment allowances, under which a firm may charge against profits 20 per cent of the cost of any new machine, with the difference that all ordinary depreciation allowances are still chargeable. So the investment allowance is a grant, not a loan, of the saved tax. The allowances were introduced in 1954, withdrawn in 1958, and reinstated in 1959.

Depreciation allowances, including investment and initial allowances, were sufficient in 1959 to cover about 70 per cent of productive investment by the private sector, and to cover about 40 per cent of public productive investment. The residue of new investment, both productive and non-productive, had to be provided from savings. Companies relied mainly on retained profits, which were in fact larger, taking companies as a whole, than net investment, and so to some extent did the profit-making nationalised industries. This course was not, of course, possible for the railways or the coal-mines, who drew all their funds for net investment from the Treasury. The table gives some idea of the load thus landing on the public sector.

Although less than half of total investment was publicly financed, a much lower proportion of this investment was covered by depreciation allowances or retained profits. The weight of public investment which had to be financed from other sources goes a long way towards explaining the difficulties the Government has in exercising monetary or fiscal control over the economy. For the necessary funds have either to be raised in taxation (a Budget surplus) or borrowed in one form or another from the private sector without unduly inflating the credit base. Monetary and fiscal measures will be discussed in later sections.

3. INCOMES, WAGES, AND PRICES.

Personal Income, Spending, and Saving.

National income is a measure of the total income accruing to residents in return for valuable services rendered. It therefore consists of the sum of wages, salaries, profits, and rents. Not all this income accrues to persons. Thus, companies do not distribute all their profits to shareholders; in 1959 undistributed profits amounted to £3,302 million. This is part of national income, but not of personal income. On the other hand, some personal incomes are not payments for services rendered. Such incomes are called "transfer payments" to emphasise that their payment does not add to the national income, but only transfers income from one recipient to another. Included in this category are retirement pensions, children's allowances, National Assistance payments, etc., amounting in 1959 to £1,637 million, and the interest on the National Debt paid out to persons. The total of personal income in 1959 was £19,676 million.

DISPOSAL OF PERSONAL INCOME, 1959

	£ million	Percentage
Consumption . .	15,715	80
Direct Taxes .	1,791	9
National Insurance contributions .	898	4½
Saving . .	1,254	6½
Remittances abroad (net)	18	-
Total personal income	19,676	100

The table shows what happened to this income. Direct taxation—income tax and surtax—took about 9 per cent of total personal income, and National Insurance contributions, which being compulsory are in effect a form of tax, took a further 4½ per cent. The remainder of personal income—called disposable income—was available for spending or saving. In 1959, total personal savings amounted to £1,254 million.

CONSUMPTION EXPENDITURE, 1959

	£ million	Percentage
Food .	4,798	30½
Drink and Tobacco .	2,000	13
Housing, fuel, and light	2,137	13½
Clothing . .	1,505	9½
Durable goods * .	1,301	8½
Other goods and services	3,974	25
Total consumption .	15,715	100

* Motor-cars, furniture, television sets, refrigerators, etc.

Four-fifths of personal income was spent on consumption goods and services. Over 30 per cent of consumption spending went on food, and almost as much was spent on drink and tobacco as was spent on housing—rent, repairs, maintenance, *plus* lighting and heating. Some consumption expenditure is subject to indirect taxation, which is the name given to taxes which are levied on particular goods and services. Thus more than three-quarters of expenditure on tobacco goes to the Government. Total indirect taxation on consumers' expenditure amounted to £2,730 million in 1959, though this was offset by subsidies—payments by the Government towards the cost of particular goods and services, mainly some foods and housing—amounting to £377 million.

Types of personal income.

The sources of personal incomes are shown in the table. Incomes from employment—including employers' contributions to National Insurance and to private pension schemes—accounted for 71 per cent of the total in 1959: a substantially higher proportion than before the war. The proportion of wages has risen slightly, and the proportion of salaries has gone up sharply. The main reason is not that salaries have risen faster than wages, but rather that the number of salaried

workers has increased much faster than the number of wage-earners There has also been an increase in the proportion of personal incomes derived from grants paid out by public authorities These include old-age pensions, war pensions, sickness benefits, childrens' allowances, student grants, and many other grants under various schemes Some of these grants were not payable before the war, and in recent years the number of old-age pensioners has been rising quite rapidly.

PERSONAL INCOME BY TYPES OF INCOME

	£ million	Percentages of total	
	1959.	1959	1938.
Incomes from Employment.			
Wages	7,975	40·5	38
Salaries . . .	4,585	23·3	18
Pay in cash and kind of the Forces . . .	389	2·0	1½
Employers' contributions to National Insurance and other superannuation schemes . . .	981	5·0	2½
	13,933	70·8	59½
Incomes from Self-employment.			
Professional persons	309	1·6	2
Farmers	442	2·2	1½
Other self-employed . .	1,142	5·8	9
	1,893	9·6	12½
Incomes from Property .	2,213	11·3	22½
Grants from Public Authorities			
Pensions and widows' benefits	736	3·7	n a
Other	901	4·6	n a
	1,637	8·3	5½
Total	19 676	100	100

The types of income which have fallen as a proportion of total income are the incomes of self-employed persons, and incomes from property The number of self-employed persons has declined, and moreover the incomes of some groups have not increased as rapidly as other incomes The fall in property incomes since before the war has been particularly striking During the war and for several years afterwards property incomes changed little—the effects of rent control, excess profit tax, and low interest rates were such that these incomes did not rise, while other incomes increased sharply In more recent years, property incomes have increased, as rent control on some property was lifted, and as interest rates rose, but nevertheless, the share of property incomes in 1959 was only about a half of what it had been in 1938. Over those two decades, there was a fundamental redistribution of income away from property-owners towards employees.

Incomes by Size.

In 1959 nearly half the population received incomes under £500, and nine-tenths under £1,000 The remaining 9 per cent of the population with incomes over £1,000 received 26 per cent of the total income, and the top 1 per cent received 8 per cent of the total. Thus Britain is still far from being an egalitarian society, income is still very unevenly distributed, but not so unevenly as before the war, when the top 1 per cent received 16 per cent of the total income.

Taxes on income are, of course, highly progressive, rising sharply as income increases Those with low incomes pay no income tax, and, in so far as they are pensioners, no compulsory contributions either. Those with incomes between £250 and £500 pay about 4 per cent of their incomes in direct taxes; for them the National Insurance contributions—over £50 deducted for an adult male, *plus* another £30 paid by the employer—are far more important than any tax. Even for the prosperous working classes and lower middle classes earning over £500 but under £1,000, tax is still only 7 per cent, and it is only in the incomes above £1,500 that taxes begin to take away a substantial proportion of income And even then those with incomes between £3,000 and £5,000 still keep two-thirds of the total It is only on incomes above £5,000 that the share taken by the State begins to exceed that kept by the individual.

INCOMES BY SIZE IN 1959

Range of income before tax	Percentage of total number of incomes	Percentage of total income received.	Percentage of total income after direct taxes	Percentage paid in direct taxes
£50–£250	19	7	8	—
£250–£500 .	28	17	18	4
£500–£1,000 .	44	49	52	7
£1,000–£1,500	6	12	12	10
£1,500–£2,000	1·4	4	3½	18
£2,000–£3,000	0·9	3½	3	26
£3,000–£5,000	0·6	3	2½	34
Over £5,000	0·03	4	2	66
	100	100	100	10

These various tax burdens somewhat change the distribution of incomes. Only 6½ per cent of the population have an income over £1,000 after tax, and the 1 per cent of population who receive the highest incomes get 5 per cent of total income after tax as compared with 8 per cent of total income before tax But the redistributive effect of taxation must not be over-stressed, the levelling-up of incomes before tax has been very much more important in making Britain rather more egalitarian than has been any taxation policy

Income and Spending Power.

In many ways figures for incomes alone substantially over-estimate the degree of equality to be found in Britain First, incomes are incomes as defined for income-tax purposes Any allowed expenses are not included, and for the self-employed and the higher ranks of management the expense allowance now adds substantially to spending power. Particularly important are cars required for business, but also used for pleasure, and as tax rates have risen, it has become increasingly profitable for such classes to claim every expense to which they are conceivably entitled There is little doubt that this adds substantially to the standard of living of those in a position to claim such allowances, although it is very difficult to see any simple way in which the taxation system could be made more equitable in this respect

Second, capital gains were not taxable (but see **G40(2)**) If one buys a security or an asset which rises in value after one has bought it, one has clearly gained extra spending power. In the U S A. realised capital gains are taxable, at a rather lower rate than income. In India the same purpose of taxing persons according to their spending power is achieved by having a tax on total expenditure, so that those who spend out of capital gains rather than out of income should be taxed as heavily In this country the whole business has threatened to become a racket Not only have individuals not had to pay tax on capital gains, a not inconsiderable advantage in the immense boom in Ordinary Share values that followed the Conservative election victory, but also they have been able by a number of devices to convert income into capital gains, and thus avoid paying income tax This possibility arises in two ways Certain individuals whose profession is dealing in securities do have to pay income tax on their capital gains, and they are therefore indifferent as between receiving dividends or capital gains. If therefore they buy shares from an ordinary tax-payer just before a dividend is due to be paid and sell it back to him immediately afterwards the ordinary tax-payer escapes the tax which would normally be paid, and gets a tax-free capital

DISTRIBUTION OF CAPITAL: VALUE OF ESTATES FOR DEATH DUTIES IN 1957–58.

Size of estate.	Number of estates	Value, £ million.	Percentages of total. Numbers	Value
£3,000–£5,000	23,919	92·6	40	12
£5,000–£10,000	19,157	137·3	32	18
£10,000–£25,000	11,944	185·2	20	24
£25,000–£50,000	3,708	131·8	6	17
£50,000–£100,000	1,313	94·0	2	12
£100,000–£500,000	554	99·6	1	13
Over £500,000	24	39·5	0·04	5
	60,619	780·1	100	100

gain instead, while the dealer is no worse off than he would have been if he had received an equivalent amount in capital gain. So there is a net saving in tax to be shared between the two appropriately. A rather similar racket operates with charities and other tax-exempt bodies. In the 1960 Budget the Chancellor took general powers to stop the loss of revenue that results from these practices, after previous Chancellors had tried to close the loopholes by making specific types of transaction illegal. This legislation was not intended to alter the system under which capital gains are tax-free. It applied only to capital gains which can be shown to have been deliberately substituted for income in order to avoid tax.

Distribution of Capital.

Spending power depends not only on income and capital gains but also on the sheer amount of capital owned, and in respect of capital Britain is still far from egalitarian. The only figures are those that arise in connection with the payment of death duties. In 1959 of those who at death left estates of more than £3,000—less than one-fifth of the total numbers dying—1 per cent owned 18 per cent of the total, and 10 per cent owned about half the total—and this in spite of a growing tendency for the rich to pass on their money before death in order to avoid death duties. Nor has there been all that much narrowing since before the war, in 1938 about half the total value of estates was accounted for by 6¼ per cent of the total number of estates. Indeed, the main change appears to have been that the fairly rich are more numerous, and the extremely rich somewhat less numerous. The vast majority still own very little, and Britain is far from being a property-owning democracy.

Wages and Salaries.

In 1959 66 per cent of personal income was paid to employees in the form either of wages, salaries, or Forces' pay. The distinction between the first two is very much a matter of convention, many salary-earners now earn less than wage-earners,

adult wage-earners for males and 6*d* more for women. (These figures are not exactly comparable, as the salary figures include some juveniles.) Monthly-paid staff earned much more, £23 on average for men as against £14 for the weekly-paid staff. But even though the weekly-paid salaried staff do not now earn more than wage earners, they are still in effect better paid, for they work shorter hours on the whole, and they are much more likely to be covered by private superannuation schemes Also they usually work in better conditions

No regular statistics are collected about salary levels, but every half-year the Ministry of Labour publishes detailed figures of the actual earnings in one week of wage-earners in a wide range of industries. Some figures are shown for weekly and hourly earnings during a week in May 1960 The average weekly wage for men was £14 2*s* , and for women a little over half this—£7 5*s* There are some quite sharp differences between industries In motor manufacture the average wage was £19, and in local government service (roadmen and suchlike) as little as £10 15*s* Farm workers, not included in the survey, earn under £10 a week For women the best-paying industry is the buses, where nearly equal pay between male and female conductors brings an average wage of £10 8*s* In the worst industry—laundries—the average wage is as low as £5 19*s* Boys (under 21) earn £6 3*s* on average, and girls (under 18) £4 13*s*.

Differentials.

Women earn on average much less than men, and juveniles usually much less than adults Before the war the gap was relatively much greater Men, for instance, earned 4 1 times as much in May 1960 as they did in October 1938, but for women the ratio was 4·5 times Nearly all this narrowing occurred during the war, when it was the common practice for wage advances to take the form of a flat-rate increase to all employees regardless of sex Since 1950 the practice has altered The usual thing has been to grant roughly similar percentage increases to all grades, and there has in fact been a slight widening of the gap

The same narrowing occurred in other differentials Skilled workers, for instance, were during the war granted the same flat-rate advances as unskilled, and there was then and, to some extent, also in the years immediately after the war, a sharp narrowing of the reward for skill in many industries As for the sex differential, the narrowing has now come to a halt, but it has not been reversed, and wages within the working-class are much less widely spread than they used to be Some would say the rewards for skill were insufficient; but, on the other hand, the upgrading of the lowest-paid has, together with the reduction in long-term unemployment, been the main means by which the grinding poverty of the worst-off members of society—with all its undesirable consequences, such as malnutrition of children—has been eliminated. Today the really numerous poor are the old, the sick, and the handicapped—and not, as before the war, families with a working head who was earning too little to make ends meet

Differentials have been a major source of industrial strife in some industries In engineering there has been continued conflict between unions with membership largely among the skilled and those with membership largely among the semi-skilled over what form demands for wage increases should take. On the railways the strife has been even more open, with the A S L E F., representing the drivers and firemen, calling a strike in 1955 to increase their members' pay relative to that of other railway workers Conflict over differentials also lay behind the London bus strike of 1958.

Overtime and Short Time.

The earnings of any individual worker depend on many factors, and are usually far above the minimum wage-rates payable for a week. They include overtime earnings, and overtime working is common for men. In most weeks 1½–1¾ million workers in manufacturing will be working overtime to the extent of 7½–8 hours. So for men the average working-week in May 1960 was over 48 hours, which is at least 4 hours above the average standard working-week without overtime In the cement industry the average working-week for men was nearly 57 hours, and in no industry was it below 44 hours Indeed, the average working-week in 1960 was higher than before the war, even though in most the standard working-week has been reduced In most industries it was cut by 4 hours soon after the war from 48 to 44 hours, and in 1960 further widespread reductions of 1½–2 hours were made

Short-time, the working of less than the standard week, has never been common since the war It has been important in particular industries at particular times, but even in February 1959, at the bottom of the recession, it was far smaller than overtime Then 132,000 workers were on an average short-time of 12½ hours—a total of 1½ million hours lost, as against 9¾ million hours of overtime in the same week

Earnings and Rates.

Overtime is not, however, the main reason why earnings exceed minimum wage-rates, for most workers earn very much more than the minimum in the standard working-week One reason is payment by results, the system of payment under which the worker's wage depends partly on output The commonest form is still the piecework system, under which pieceworkers are paid a fixed low rate per hour for each hour worked *plus* a fixed piecework price for each operation performed, but increasingly employers tend to prefer as a more effective incentive some scheme under which the bonus payment is related to the output of a larger group or to that of a whole factory With payment by results systems—these cover 38 per cent of workers in manufacturing industry—earnings rise as productivity rises, and, as usually such workers also participate in advances in wage-rates negotiated between employers and unions, the gap between earnings and wage-rates tends to widen for them. So workers not paid by results press for similar advances for themselves, and in times of booming trade get them under a wide variety of names and forms -merit payments, lieu rates, compensation bonuses, etc

Between 1947 and 1959 wage-rates rose by 83 per cent and earnings by 111 per cent The advance in rates was little more than the rise in prices—only 9 per cent—so that anyone who actually earned the minimum rate throughout was little better off But earnings rose by 26 per cent more than prices, so that the main source of the extra real income of the working-class is to be found in the widening gap between earnings and rates This was particularly so up to 1953, since between 1947 and 1953 the real value of the wage-rate fell a little Since then there has been a slow growth in the real value of the wage-rate, as well as a continued growth in the excess of actual earnings over minimum rates.

Wage Negotiation.

In Britain 9¾ million workers belong to 653 different trade unions Most of these unions are very small, 466 having less than 2,500 members, but 17 have a membership of over 100,000 The main job of unions is collective bargaining with employers, and in most industries most employers also belong to associations which bargain collectively on their behalf. Some big firms, however, prefer to remain outside the associations, and strike their own bargain with the unions—Ford's, for instance Before the war many firms tried to encourage the formation of Company Unions, *i e*., of unions confined to employees of a single firm, but this is now uncommon In some lowly paid trades—catering, baking, dressmaking, and others—minimum wages are fixed by Wages Boards or Councils set up by the Ministry of Labour, and representatives of the workers and employers, and independent members, meet together to reach agreement on the settlement to be recommended to the Minister. But over most of industry the aim of collective bargaining is to reach voluntary agreement, and the Ministry of Labour intervenes only when no agreement is reached Even in the nationalised industries, the Government does not usually intervene until negotiations between the Boards and the unions break down.

The usual pattern of negotiation is like this First, the union puts in a claim for an all-round increase, usually much larger than it expects to get. Then after a time the employers reply, often offering a much smaller increase, and sometimes none at all They then argue round a table until either they reach agreement or they definitely fail to reach agreement. If the latter happens the next step varies considerably from industry to industry. Many industries have their own "conciliation" machinery, in which outsiders try to help the two sides to reach agreement Some, though not many, also have their own "arbitration" machinery, in which outsiders can recommend a solution of the dispute, which is sometimes binding and sometimes not It depends on what the two sides have agreed on in advance Many industries have no machinery of their own, and depend on the general facilities the Minister of Labour can offer He may, as he did in the printing dispute, appoint an impartial conciliator; or he may, with the agreement of both parties, refer the matter to the Industrial Court, which arbitrates between the parties, or he may set up a Court of Enquiry which enquires into the dispute and makes recommendations, which are not binding on the parties; or he may decide to do nothing at all, if he judges intervention to be useless. Nor need either unions or employers call him in; the former may opt to put pressure on the employers immediately either by strike action, or by banning overtime or piecework, or by other action Until 1956 the Minister of Labour also had the power, if he chose, to refer a dispute to the National Arbitration Tribunal, even without the consent of one of the parties, but this power has now been abolished. Thus the Government in this country has little power to control wages directly, or to impose agreements. The Minister of Labour can, for example, delay the authorisation of Wages Council recommendations, but in the main the role of the Minister is confined to mediating between independent parties. There is not even the right that exists in the U S A to impose compulsorily a "cooling-off" period of 60 days, still less the fixing of wages characteristic of Communist states

Important Negotiations.

A few negotiations are particularly important in determining how wages rise in a year, for the pattern of later settlements tends roughly to follow those of earlier settlements Probably the most important of all are those between the Confederation of Engineering and Shipbuilding Unions —an organisation representing 3 million workers—and the Engineering Employers' Federation, as this single negotiation directly affects the wages of 3½ million workers, and indirectly many more On several occasions since the war negotiations between these two have broken down, and only finally been settled after a Court of Enquiry had recommended a compromise wage-advance, once in 1957 during the course of a strike The Confederation is a special negotiating body comprising all the unions who have members working in the engineering and shipbuilding industries. These include many small skilled workers' unions, such as the Patternmakers' Union, but they also include, besides the ¾-million-strong Amalgamated Engineering Union, the two large general unions, the Transport and General Workers' Union, with over a million members, and the General and Municipal Workers' Union, with not far short of a million These last two represent the semi-skilled and unskilled workers, and conflict between them and the skilled unions concerning differentials is common

The other really important negotiation is that between the British Transport Commission and the three railway unions—the large National Union of Railwaymen, representing most grades, the Amalgamated Society of Locomotive Engineers and Firemen, representing the drivers and the firemen, and the Transport Salaried Staffs' Association, representing the ticket collectors, railway clerks, etc The importance of this negotiation lies in the fact that railwaymen are comparatively badly paid, but, as the Transport Commission runs a deficit, any wage advance has effectively to be paid for by the Government. Time and time again—for example the rise in early 1960 arising out of the Guillebaud Report on railway pay—wage advances have been given to railwaymen with the purpose of trying to narrow the gap between them and other workers, but the advance given to railwaymen then acts as a guide to other settlements, so that the railwaymen remain relatively as badly paid as before

Strikes.

The strike is the unions' weapon of last resort. Most unions maintain strike funds in order to support their members when they call them out on strike; but these funds are small, and strike pay is usually very much below normal wages --£2 to £4 a week as against an average wage of £14 So unions cannot afford to call strikes irresponsibly, and major official strikes are uncommon In most years there will be one or two, but not more, and the total number of working-days lost is usually negligible—less than one day per head Even in the industry affected the lost working-days are usually made up in the following weeks by overtime

Nevertheless, the big strikes are important, for the success or failure of one big strike can affect the results of all the other collective bargaining under way at the time They can also affect the awards of arbitration tribunals, since, in the main, arbitration awards tend to follow the pattern of settlements already made in other industries There is no purpose in a tribunal trying to be fair if it cannot get its awards accepted So the settlement reached as a result of a strike often determines the amount by which wage-rates will rise on average over all industries The successful engineering strike in 1957 was the main reason why in that year most workers got a rise of 8s on average The failure of the London bus strike in 1958 and the relative failure of the printing strike in 1959 were among the factors which led to rather slower increases in wage-rates during 1958 and 1959 than in most previous years.

Most strikes are neither large nor official, nor about wages An official strike is one called by a union, usually by decision of the national executive, and is usually the result of a breakdown in collective bargaining about wages But unofficial strikes called by local leaders without the

STRIKES

Industry	In 1959			In 1958 Working-days lost, thousands

Total	2,073	644	5,250	3,462

authorisation of unions are usually about other matters None of the big unofficial strikes which have plagued the London Docks since the war was about wages, but usually about some relative triviality that only bore witness to the thoroughly poor state of labour relations in that industry. Much the same may be said about the continual strikes in shipbuilding, many of them caused by demarcation disputes concerning which jobs should be done by which type of skilled worker These sort of strikes are really a form of industrial protest, and the employers have to bear their share of the blame.

In 1959 there were in all 2,073 strikes One of these, the official strike in the printing industry, led to a loss of 3½ million working-days, twice as much as all the other strikes put together Without the printing strike, the average strike involved 250 workers and lasted just over three days Most indeed were still smaller, in mining the industry with much the largest number of strikes, the average strike involved 150 workers and lasted under two days

In most industries there are very few strikes The main strike-prone industries, apart from the mines, are vehicles, shipbuilding, and docks, but even in these the extent of strikes must not be exaggerated In shipbuilding, with the worst record of disputes, losses are only just over one day a year and, if that were all, could safely be ignored. But, of course strikes are also a symptom of industrial trouble, and it is no accident that in shipbuilding productivity has scarcely improved at all since the war.

Prices and Real Incomes.

The aim of a union is to get for its members a higher standard of living, and its success depends on the extent to which wage-advances exceed the

WAGES AND PRICES.
(1947 = 100)

May.	Weekly wage-rates *	Weekly earnings *	Index of retail prices	Real wage-rates	Real earnings
1949	108	113	109	99	104
1951	118	129	121	98	107
1953	135	149	141	96	106
1955	152	173	147	103	118
1957	169	194	160	106	121
1959	182	211	167	109	126
1960	187	226	169	111	134

* The figures for wage-rates cover a wider group of workers than the figures for earnings, and the two series are therefore not strictly comparable

rise in the cost-of-living. Until 1953 average wage-rates (though not earnings) lagged behind the rise in prices Since then they have risen somewhat faster than prices, and the standard of living of the workers has been rising fairly steadily as a result. Much the same has been true of other groups Salaries lagged behind the rise in prices probably even more during and immediately after the war; but since then have risen rather faster than wages, partly because of more effective negotiation on their behalf by their unions—or their professional organisations Real incomes of pensioners and of those on National Assistance have been going up too in the 'fifties, after the serious erosion of their value in the later 'forties. The retirement pension is still inadequate for a decent life, but that is because when the National Insurance Scheme was set up in 1948 it was believed that the nation could not afford anything better, and not as in 1951 because inflation had eroded the value of the pension Something too has been done for holders of other pensions, such as retired civil servants and postmen, and by now price inflation cannot be deplored mainly because it leads to much hardship The main danger is that British exports become uncompetitive, and that the balance of payments position deteriorates

Price Changes.

In the calculation of real wages it is usual to make use of the Index of Retail Prices, commonly called the cost-of-living index This index is calculated monthly by the Ministry of Labour, and in a few industries with sliding-scale agreements (iron and steel, building) wages are adjusted to take account of changes in the index In other industries the change in the index naturally has a large influence on the course of negotiations. Indeed, up to 1958 it was probably the dominant influence In no year before then had the annual rise in prices been less than 2 per cent In most years it was rather higher, and in some years it was much more—in 1951–52, nearly 10 per cent 1958 and 1959 were, however, years of stable average retail prices

Price changes have not been similar for different types of goods For instance, between January 1952 and January 1956, when the total index rose by 16 per cent, food went up by 25 per cent, rents and rates by 18 per cent, fuel and light by 28 per cent, and services by 19 per cent, but the prices of clothing, drink, tobacco, and durable household goods (furniture, TV sets, washing-machines, etc) scarcely altered In those years, average prices went up least for the rich, and most for the very poor, particularly for the pensioners, for whom rent, fuel, and food form a much higher proportion of total expenditure than for most households

The Causes of Price Inflation.

Prices charged in the shops are determined by a great many factors, over many of which the Government has little or no control First among these is the price of imports Prices of imported food and raw materials are determined in the world markets, in which Britain is only one of many purchasers. In the raw material markets the U S A is usually the dominant purchaser, and prices depend greatly on the level of economic activity there. In the food markets British

* *I.e.*, proportionate importance of item in total expenditure.

purchases are much more important, since the U.S.A. grows most of its own food, and is a large exporter of some foods. Prices in these markets are continually changing, and can fluctuate wildly. For instance, the average price of copper rose 40 per cent between 1954 and 1955, and then fell back in 1957 to 10 per cent below its 1954 level. Fluctuations at the time of the Korean War were even more fantastic. The price of wool rose over four times, and then came down just as abruptly to only a quarter above its earlier level; the price of rubber behaved similarly. The large rise in import prices, coming on top of the rise that had been brought about by devaluation, was the real reason why the cost-of-living index shot up sharply in 1951. Since then, however, the dominant trend of import prices has been downwards, and changes in prices of imports cannot be directly blamed for the continuing rise in prices since 1951. The source has to be looked for in the tendency of wages, salaries, profits, and other incomes to rise faster than output, and this they have done in almost every year since the war.

Wages and Prices.

Wage increases are probably the most important—for this reason. When a trade union negotiates a wage advance for all or most of the employees in an industry, firms will immediately consider whether they should increase their prices to cover their increased wage-costs. As it is common practice for firms to fix the selling prices of their products by first calculating the direct costs of labour and of materials, and then adding on a percentage to cover overhead costs and profits, they will tend to want to raise their prices not only to cover the cost of the wage advance but also to cover their percentage addition. Moreover, in deciding whether or not their customers will stand for such increases, firms will be influenced by the knowledge that their competitors have to pay the increased wages too, and will probably therefore be raising their prices. So industry-wide wage advances—and changes in costs of materials—are particularly likely to be passed on to the consumer, and, as wage-earners are also consumers, to generate further demands for wage advances to cover the increased prices. Profits per unit also go up under this tendency to set prices on a *cost-plus* basis, but it is the wage advance which tends to set the spiral off, by providing the opportunity for price increases.

Once this spiral gets going, it is very hard to stop it. In general, the requirement is that wage earnings should not rise faster than productivity (output per man). But, as in some industries productivity is very slow to rise, and as it would be unfair and impracticable to exclude their workers from participating in any general rise in the standard of living, this requirement involves that in industries with a rapid growth of productivity wage advances should be kept well below the rate of rise of productivity. For two reasons this is rather difficult. First, rising productivity often raises the wages of some workers in these industries automatically, because they are paid by results or through some incentive scheme. The rise of wages from this source takes the form of a tendency on the part of earnings in these industries to rise faster than wage-rates; but that does not mean that all employees benefit, or that there is any likelihood that the unions in these industries will not press for the same rate of increase in wage-rates as is achieved in the slowly-growing industries. Second, employers in the rapidly-growing industries have far less reason to resist demands for wage increases than those in slowly-growing industries. Indeed, they are quite likely to bid up wages in order to get the labour they need, rather than to try to hold down wages.

There are therefore major problems in preventing a faster rise in wages than in productivity, with its consequence of rising prices. And once a wage-price spiral has started, the problems become more acute because unions and employers become accustomed to substantial annual advances in money wages. A main source of continuing price inflation has been the tendency of money wages to continue to advance at a rate that was appropriate when the cost-of-living was going up sharply, but ceased to be appropriate in later years. The trend is shown in the table, from which it will be seen that it was not until after 1958 that there was any substantial slowing-down in the rate of rise of wages per unit of output. Import prices fell sharply in 1958, and this made an important contribution to price stability in that year. 1959 was an exceptionally favourable year. Industrial output, which had increased little over the previous three years, shot up, and there was in consequence a substantially greater increase in productivity than can be looked for over a run of years. It would be dangerous to assume, on the basis of the stability of prices in 1958 and 1959, that the wage-price spiral had been finally brought under control at the end of the 1950s.

COST AND PRICE CHANGES

Annual percentage rate of increase in	Period					
	1949–59	1949–51.	1951–54	1954–57	1957–58	1958–59
Wage and salary costs per unit of output	5	5	4	6	4	2
Profits and other incomes per unit of output	4½	1	6	3	5	4
Costs of imported goods	3	25	−4	2	−7	−1
Prices of all goods and services	4½	8	2	4	2	1

The Stopping of Price Inflation.

There are several possible methods of attack on the inflationary spiral of wages and prices. Perhaps the most fundamental and certainly the most helpful to other objectives of economic policy, is to achieve a faster rate of productivity growth. The faster the growth of average productivity, the faster can average incomes rise without an increase in average prices. But however vigorous the attempts to increase productivity, it would probably be unrealistic to think in terms of an increase much greater than 3 per cent per annum. If wages and other incomes rise more rapidly than this—as they did throughout the 1950s—increases in productivity alone cannot secure price stability.

Comprehensive and detailed Government control of wages must probably be ruled out for political and institutional reasons, and so must comprehensive and detailed control of prices. Either would involve a much more "controlled" economy than we have at present, and experience suggests that such detailed control would involve a major loss of flexibility in the economy. At the other extreme, general exhortations to unions to exercise restraint on wages, and to manufacturers to exercise restraint on prices, have probably had little effect.

Various intermediate lines of approach have been or could be tried. In 1948–50, the Government secured the co-operation of the T.U.C. in the wages "freeze". For a time this was successful, but the increases in prices which followed the devaluation in 1949 made substantial increases in wages unavoidable, and the freeze was abandoned. By setting an example in the nationalised industries over which it has a more direct influence,

the Government can encourage employers to take a tougher attitude towards wage claims This was one strand of policy in the later 1950s, and the firm line taken in the London bus dispute in 1958 probably moderated other wage claims for a time. Its disadvantage is the obvious unfairness of a policy which is most likely to be effective in nationalised industries, many of whose workers are relatively badly-paid. Another approach is to lower tariffs or remove quotas on imports, thus exposing some manufacturers at home to tougher competition from abroad Manufacturers would be less able to raise prices without losing markets, and unions would be less willing to press wage claims if there was a real danger that some of their members would lose their jobs as a consequence. But the gains from a policy which depends for its success on higher imports have to be weighed against its effects on the balance of payments Or again, many prices in the economy are directly influenced by Government indirect taxation which raises the price of some goods, and Government subsidies which lower the prices of other goods. By manipulating its tax and subsidy policies, the Government can exercise a powerful influence on the price level· though of course any reduction in indirect taxation or increase in subsidies would probably have to be financed by increases in direct taxation, which may in turn have undesirable effects on incentives to harder work and greater effort.

More indirectly, the Government can attempt to control the wage-price spiral by controlling purchasing power through its monetary and fiscal policies If purchasing power is curbed, manufacturers find it more difficult to raise prices, and the bargaining power of unions may be reduced In the 1950s, the Government relied heavily on fiscal and more especially monetary policies, the nature of which will be examined in later sections The main danger is that curbing purchasing power is likely to curb the rise in output and curb the rise in productivity, so that attempts to control the wage-price spiral in this way could result in the stagnation of the economy

It is clear that there is no easy solution – there are difficulties and disadvantages attaching to every possible measure for controlling price inflation Economists—and politicians—disagree as to the priorities which should be attached to the various measures and certainly the problem of inflation was not solved in the 1950s.

4. MONEY, BANKING, AND FINANCE.

The Radcliffe Report.

In September 1957 the Chancellor set up the Radcliffe Committee to report on the working of Britain's monetary institutions The report of the committee, published in 1959, contains a detailed description of the monetary institutions of this country, and a systematic appraisal of monetary policies in the 1950s It is complicated, because the monetary system is complicated, but it is written in terms which can be understood by the layman Any reader who finds the following account inadequate should consult it.

Money.

In Britain money consists of bank-notes and coinage Bank-notes—mainly in denominations of £5, £1, and 10*s* —are issued by the Bank of England, which has been publicly owned since 1946, and which acts in effect as an agent of the Government. Certain Scottish banks also have the right to issue notes, but this right is unimportant, as by law they have to hold £1 in Bank of England notes for every additional £1 of notes they issue So Scottish bank-notes may be ignored in this account

The total size of the bank-note issue is not a good guide to the amount of purchasing power in the economy The Bank of England stated in its evidence to the Radcliffe Committee that it was now its policy to issue bank-notes in accordance with the convenience of the public, and not to use this means of controlling the amount of purchasing power As a result, the various checks on the size of the note issue—in particular the Parliamentary control over the fiduciary issue, *i e* the permitted maximum level of the note issue—have become functionless and may be ignored An increase in the value of the note issue is now only a symptom and not a cause of inflation

Credit and Monetary Policy.

What matters is the amount of purchasing power available to the public. Most private expenditure is financed out of income—after paying taxes—and most government expenditure out of taxes; but most investment, public and private, and a growing amount of purchase of durable goods by consumers, is not financed out of income, but out of borrowing of one kind or another. And the primary purpose of monetary policy must be to keep the total of this kind of expenditure out of credit in line with the amount of savings private individuals and profit-making companies are prepared to make out of their incomes

The details of this task are complicated, but the main outlines are straightforward enough. First, in many fields the Government has only very restricted powers to influence behaviour It cannot compel persons or companies to save, it can only offer them inducements to do so in the form of high interest rates or of tax concessions on receipts from interest And it is dubious whether these have very much effect in encouraging saving Nor in general has it very much direct power over expenditure out of credit It can and does control the conditions under which hire-purchase agreements are made—and this does, temporarily at any rate, make a great deal of difference to the amount of goods bought on hire-purchase It can to a certain extent influence private companies in their investment policies by granting and withdrawing incentives to investment (see **G19(1)**); but it is doubtful quite how much influence these changes have And it can, if it chooses, exercise direct control over building, by allowing building only on licence This power, however, is not now used in order to control the level of investment, but only in order to encourage it in depressed areas and discourage it elsewhere The only authorities over whose investment the Government does have real control are the nationalised industries, and, as the Radcliffe Committee pointed out, there are obvious disadvantages in any system whereby investment in public utilities is determined, not by the need for such investment, but by the need to balance savings and investment

The two main means remaining are fiscal and monetary control The first is straightforward enough, if the Government thinks there is going to be a shortage of private savings it raises more in taxation or reduces its current expenditure and so increases the Budget surplus (see **G33(2)**) The second form of control is much more complex, in principle, the aims are twofold One is to keep the amount of credit-creation down (or up) to the required extent, the second is to ensure that the Government gets the share of savings it needs to cover its investment programmes The complexity arises from the interrelations between these two tasks.

The Government as Borrower.

The Government is a heavy borrower from the rest of the economy In 1958 total public borrowing—by government, nationalised industries, and local authorities—from the private sector stood at £30,727 million, equivalent to 1·68 times the annual national income. Most of this immense National Debt was built up during the war, when government expenditure far exceeded taxation, but the total continues to advance year by year, owing to the heavy capital requirements of the nationalised industries.

The Government borrows in six main ways. First, the issue of bank-notes is in effect a form of government borrowing. Second, it borrows from foreign governments. Third, it borrows from companies through tax reserve certificates, which are a means by which companies let the Government have the taxes they will have to pay on profits as the latter are earned, rather than when the taxes legally become due. Fourth, it borrows direct from private individuals through the various forms of national savings. In all forms of national savings, the Government pays interest—or in the case of premium bonds prizes in *lieu* of interest to

the winners of the monthly draw—to the holders, who have the right either on demand or at short notice to demand the repayment of their loans Interest rates vary according to the type of savings They are highest on savings certificates,

where extra payments are made to encourage the holders to keep them for a period of several years, and lowest on the deposits in Post Office and Trustee Savings Banks For all types of national savings there are limits on the amount any one individual may hold In 1958 the average holding was £115 a head, and the total amount of national savings was £5,756 million.

Gilt-edged Securities and Treasury Bills.

The fifth and sixth methods of borrowing are through the market The main method is through the Stock Exchange by the issue of fixed-interest securities, called gilt-edged securities In 1958 the net amount owing on all such securities was £14,489 million—nearly a half of total public debt. in addition, the local authorities owed another £477 million on their issues of securities Most gilt-edged securities are promises to repay at a specified date in the future the amount originally borrowed, and in the meantime to pay interest at a fixed rate each half-year Some gilt-edged securities are irredeemable, and consist therefore simply of the promise to pay the interest in perpetuity

Most gilt-edged securities are held by institutions It is estimated -with a large margin of error—that only 21 per cent are held by private individuals, to which should be added another 6 per cent owned by trustee funds, friendly societies, and trade unions 22 per cent appear to be held by the banks and discount houses, 18 per cent by the other major financial institutions of the country, and 12 per cent by overseas holders (corresponding to the sterling balances of overseas countries, see G8(2)), leaving 22 per cent unaccounted for Gilt-edged securities, unlike national savings, are not liquid assets Until they become due for repayment they can only be sold on the Stock Exchange for what they will fetch, and variations in their market value are quite considerable In 1958 their average market value was 21 per cent below their nominal value, the degree of depreciation depending very closely on the length of time

to repayment On short-dated bonds, due to mature in less than five years, it was only 3 per cent, and on irredeemable stock it was 38 per cent Fluctuations in these market values play a very important part in the working-out of monetary control

The sixth form of government borrowing is by means of Treasury Bills, of which £2,938 million were outstanding in 1958 A Treasury Bill is an extremely short-term loan to the Government—usually for three months Each week the Treasury offers for sale some £300 million of these, and a number of specialised institutions bid for them The difference between their bids and the value of these bonds on repayment is called discount, and is a substitute for interest These bills play a crucial role in the monetary system, for it is by affecting the rate of discount on Treasury Bills that Bank Rate influences monetary conditions in the economy, but more of that a little later

Government Borrowing and Liquidity.

Monetary policy consists largely in varying the ways in which the Government borrows If it borrows by means of national savings it is most likely that it will be borrowing genuine savings out of income, and thus not adding to inflationary pressure Likewise, if it borrows from life insurance companies or from pension funds by selling them long-term government securities, it is also borrowing genuine savings out of income, as the investment funds of companies and pension funds are merely the premiums paid by policy-holders and represent savings towards the cost of their retirement But if they borrow from the banks—and particularly if they borrow through Treasury Bills—the same cannot be said Far from being deflationary, borrowing on Treasury Bills is inflationary, because it adds to the base on which the granting of credit rests All financial institutions have some policy regarding liquidity In general, they all follow the principle that they should maintain reserves either of cash or of assets which can be immediately converted into cash to meet any foreseeable sudden increase in their commitments But they do not hold all their assets in liquid form The chance that all their creditors will simultaneously demand their money back can be ruled out, and therefore most of them act on the principle that they should maintain cash or other liquid assets to cover some percentage of their total outstanding commitments. If therefore the Government borrows more on Treasury Bills and less by other means, this action increases the amount of liquid assets about and therefore the total lending which financial institutions think it safe to make And, conversely, if the Government borrows less on Treasury Bills and more by other means it tends to decrease the total lending which financial institutions think it safe to make

The Commercial Banks

In the centre of the financial world stand the commercial banks, and the first purpose of any credit squeeze is to put pressure on them by reducing their liquidity By convention, the London clearing banks—which include the five large banks with branches all over England—have a rule that they should always hold at least 30 per cent of their assets in liquid form This rule theoretically enables the Bank of England to put heavy pressure on them when it wants to by funding debt. Actually the system does not work as easily as this would make it sound, because in practice the banks hold much of the rest of their assets in nearly liquid form (see table) In June 1960, for instance, nearly 20 per cent of their assets were in gilt-edged securities, even after a period of heavy sales, and the banks hold mainly short-dated securities So, if the banks want to they can by selling such securities maintain their liquidity and still go on increasing their advances, which are the loans the Government really wants to squeeze In early 1960 they did just this, and prevented the Government's credit squeeze from being effective

The Control of the Commercial Banks.

The means by which the Bank of England puts on pressure works in two ways The first is by

open-market operations, in which the Bank deliberately sells more government stock than it otherwise would. The purchasers pay by cheque, and thus create a debt from the commercial banks to the Bank of England. Such debts have to be settled in cash, and so pressure is put on the banks' liquidity. The second is Bank Rate. If Bank Rate is raised it has the immediate effect of raising the rate of discount on Treasury Bills. A high rate of discount on these makes them appear attractive investments to those who do not normally buy them, and the commercial banks find it difficult to get as many of them as they would like. So again there is pressure on the banks' liquidity.

effective as might be expected. Big businesses, in practice, scarcely suffer at all, for they are in the best position to tap other sources of credit. Quite a good example is provided by the hire-purchase finance companies. During the credit squeeze of 1956–58 the banks were asked by the Chancellor of the Exchequer to hold down advances, and in particular not to increase advances to hire-purchase finance companies. They did so, but the companies had no difficulty in getting the money they needed by borrowing direct from the public at high rates of interest. The real sufferers tend to be small businesses and professional people, who do find it hard to obtain credit elsewhere, but even they may be able to do

* Excluding balances with other banks, items in transit, etc.

Faced by such pressure, the banks have to take steps to restore their liquidity either by selling securities or by calling in advances. Neither method brings in much cash directly, for since the banks will be paid by cheque rather than in cash, they have to go on until the depletion of deposits caused by the paying of these cheques cuts down the total of deposits to the level where liquid assets once again represent 30 per cent of the total. To this there is one major exception, if the Bank of England buys the securities the banks sell—and the need to ensure an orderly market may force it to do so—then selling securities brings more cash into the banks, and thus enables them to replenish their liquidity.

Since 1958, the monetary authorities have had the power to call upon the banks to make "special deposits" in cash with the Bank of England. Unlike other deposits of the banks with the Bank of England, special deposits cannot be treated as forming part of the liquid assets of commercial banks. This is in effect another way of putting pressure on the liquidity position of banks: the necessity of making such deposits could force them to sell securities or reduce advances. The first calls for special deposits—amounting to 1 per cent of total deposits to begin with, but later increased to 2 per cent of total deposits—were made in 1960.

Bank Advances and Other Credit.

Bank advances are the simplest of all forms of credit, the customer is just given the right to sign cheques beyond his credit account, and interest is charged on the overdraft. In the late 1950s, a new form of advance—the personal loan—was introduced by some banks. These are granted to customers who would not earlier have been regarded as credit-worthy. A higher rate of interest is charged than on ordinary overdrafts, and more specific rules about repayment are laid down.

Most advances, however, are made to business, particularly to small business, and to farmers. An analysis is shown in the table. In business the common practice is to finance working capital—stocks and work-in-progress—out of bank advances, and to depend on more permanent forms of borrowing for the purchase of fixed capital. But there are no fixed rules, business gets its finance wherever it can, and in fact there is such a variety of other ways in which it can get capital that a squeeze on bank advances alone is not as

so—by, for instance, taking out a mortgage on their property or by buying their equipment on hire-purchase where previously they had paid cash, or by cashing some national savings.

The Radcliffe Committee discussed at length how effective a squeeze on the banks was likely to be, and in general their conclusion was that it was not likely to be very effective, because most borrowers would usually find other sources of credit. The other sources would usually be more expensive, but they thought this mattered very little, as interest payments form only a small part of most business costs, except in very highly capitalised industries, most of which are now publicly owned. Interest does matter in housing, the monthly interest payments due on a mortgage to a building society can go up substantially when the rate of interest goes up, although usually for existing, as opposed to new, mortgages no more money is asked for; instead the term of the mortgage in years is extended by cutting the capital repayment each month. But in hire-purchase, where service charges far exceed the interest element in any loan, interest is of trivial importance. The Committee thought that a credit squeeze could substantially increase the inconvenience of borrowing by forcing persons who wanted to borrow to have to shop around for funds instead of just going to their bank and arranging an advance, and that this would,

temporarily at any rate, serve to deter a number of borrowers, and thus cut down the amount of spending out of credit. But running through the report is a scepticism concerning the likely general effectiveness of monetary policy as an anti-inflationary weapon of control—and an even greater scepticism concerning its utility as an anti-deflationary weapon. One may be able to discourage spending on credit by making it hard to get. It is bound to be far more difficult to encourage spending by making credit easily available, if business prospects are so poor that no investment looks as if it will be profitable. Before the war the limit on bank advances was not credit policy, but simply the inability of the banks to find any other credit-worthy customers.

The Stock Exchange.

The banks through their advances are the main providers of short-term credit, but most long-term credit is provided through the Stock Exchange. In 1959 the total market value of all securities traded on the Stock Exchange was £39,020 million, of which £22,588 million represented stocks or shares in public companies. There are three main types. Debenture Stock is simply a fixed-interest loan. Preference Stock is a fixed-interest loan, with provisions for waiving the interest if the company fails to earn profits. Preference shareholders cannot get a company declared bankrupt if it does not pay them a dividend; but Debenture holders can. The third type—and much the most important—is Ordinary Shares. Nominally the owner of an Ordinary Share is a part-owner of the company concerned, with most of the rights of ownership. He has no right to any particular dividend or interest payment, but only the right to participate in net profits if there are any. In 1959 Ordinary Shares on the Stock Exchange were valued at £20,486 million. Debenture Stock amounted to £1,133 million and Preference Shares to £1,629 million—both very low figures in relation to the value of Ordinary Shares, and to the value of government securities, which stood at £14,778 million. So in effect for the ordinary investor on the Stock Exchange the main choice was between buying a fixed-interest gilt-edged security and an Ordinary Share.

Each type of holding has obvious advantages. The fixed-interest security brings in a guaranteed income, the Ordinary Shareholder has no such guarantee, though in practice during the 1950s the risk of a decline in dividend was small. But in a time of inflation the risks attached to holding fixed-interest securities are in some ways greater than those attached to holding Ordinary Shares, for while Ordinary Shares appreciate in market value when there is inflation, fixed-interest securities tend to fall in market value, because the Government is forced to increase interest rates as an anti-inflationary measure. Furthermore, in the long run the growth of the economy tends, even without inflation, to raise the value of Ordinary Shares by increasing the amount of business done by companies. And, lastly, for investors who pay tax at heavy rates on their incomes—and most large personal investors in the Stock Exchange are rich people—capital gains are worth much more than income in dividends. So for private investors, the Ordinary Share was a much better bet in the 1950s; and because Ordinary Shares were so popular, the yield on such shares—the ratio of dividends to market value—fell below the yield obtainable on Government securities in 1959 and 1960. Historically, the greater security of gilt-edged holdings has normally been reflected in lower yields. If inflation is controlled, and if the prospect of industrial expansion became less bright, the "normal" pattern of yields may well return—and this will involve a fall in the price of Ordinary Shares relative to the price of Government securities.

The Ownership of Ordinary Shares

Most Ordinary Shares are held by private individuals, but increasingly in recent years holdings by insurance companies and pension funds have become more important, because of the growth of private superannuation schemes. Insurance companies and pension funds cannot afford to take risks, so still the main bulk of their funds are invested in fixed-interest securities, but they have been showing a growing tendency to increase the proportion of their funds invested in Ordinary Shares. This switch, by lowering the demand for gilt-edged securities relative to Ordinary Shares, contributed to the downward pressure on the prices of gilt-edged securities. Further pressure may result from the effects of the legislation to change the laws governing trustees introduced in 1960. Most trusts lay down that investment may only be made in trustee securities—gilt-edged or other virtually riskless securities—so that in general trustees were not able to invest in Ordinary Shares. But the legislation gives general permission for trustees to invest up to 50 per cent of their funds in the Ordinary Shares of large companies. Clearly it was inequitable to prevent trusts from investing in the only security which in a time of inflation was likely to maintain its value.

Monetary Control in the 1950s.

The Radcliffe Committee was required to consider the working of Britain's financial institutions, and its report is largely a factual account of how the system actually works. The activities of the main financial institutions are analysed. Representatives of each type gave evidence on the sort of work they did, and on the kind of principles they worked on in deciding how to invest their resources. In the light of this evidence the Committee worked out its assessment of the effectiveness of monetary policies during the 1950s. Under the Labour Government there was no major use of monetary policy. Bank Rate, for instance, was kept at 2 per cent throughout, and the rate on Treasury Bills was only ½ per cent. Instead the Government then relied on controls and on fiscal measures to keep inflation in check. For this non-use of monetary controls there was, in fact, a very strong case, the pent-up demand for goods was so strong, and the funds available to companies and individuals so large, that monetary restriction would not have made

INTEREST RATES 1948–60

	Bank Rate *	Treasury bill-rate *	Rate of yield on. Irredeemable government bonds †	Ordinary Shares †

1958	4–7	3–6½	5·0	6·2
1959	4	3–3½	4·8	4·8
1960 (January–June)	4–6	4–5	5·3	4·4

* Range during year. † Annual average.

very much difference. When the Conservatives returned to office one of their first actions was to raise Bank Rate to 2½ per cent, and very soon after that to 4 per cent. It was then reduced, but raised again in 1955–57, to reach a peak in the crisis of 1957 of 7 per cent. Thereafter it was reduced, and was increased again during 1960. The rate on Treasury Bills followed a similar course, but it gradually crept rather nearer to Bank rate. At the same time long-term interest rates rose sharply. In 1948 the rate on irredeemable stock was 3¼ per cent, by early 1960 it stood at 5¼ per cent, and by then considerably exceeded the rate of return on ordinary shares.

In addition to influencing the cost of credit by manipulating interest rates, the Government influenced the availability of certain sorts of credit through the credit-squeeze. At times it made it more difficult for the banks to extend their lending by operating on the banks' liquidity position, and it also issued more or less strongly-worded "requests" that banks should restrict the growth of, or secure a reduction in, their advances.

A form of monetary control which was particularly important in the 1950s was the control of hire-purchase. By increasing or lowering the proportion of the price which has to be paid as a down-payment, and by reducing or lengthening the length of time over which repayments can be made, the Government was able greatly to influence the volume of hire-purchase transactions, and therefore the use of this particular form of credit. These controls, of course, only affect the rather narrow class of goods—cars, furniture, washing-machines, television sets, etc.—for which a substantial proportion of sales are on hire-purchase terms. In consequence, the output of those industries concerned with the manufacture of these goods fluctuated widely.

The Effectiveness of Monetary Controls.

This is a subject on which there is vigorous controversy among economists. Not all of them accept the conclusions of the Radcliffe Committee, which had this to say about monetary policy in the 1950s (para 469):

> "(1) The obstructions to particular channels of finance have had no effect on the pressure of total demand, but have made for much inefficiency in financial organisation.
>
> "(2) the controls of hire-purchase terms have had sizeable impact, of a once-for-all kind, on each major charge.
>
> "(3) these sizeable effects on total demand have implied major directional effects (*i.e.* effects on particular kinds of expenditure and industry), which, though sometimes deliberately sought, have in general been detrimental to industrial efficiency."

They go on to add (para. 472):

> "We are driven to the conclusion that the more conventional instruments (*e.g.* Bank rate) have failed to keep the system in smooth balance, but that every now and again the mounting pressure of demand has in one way or another (generally *via* the exchange situation) driven the Government to take action, and that the quick results then required have been mainly concentrated on the hire purchase front and on investment in the public sector which could be cut by administrative decision. The light engineering industries have been frustrated in their planning, and the public corporations have had almost equally disheartening experience. That these two should be the 'residuary legatees' for real resources when sharp adjustments were called for is not a comforting thought. It is far removed from the smooth and widespread adjustment sometimes claimed as the virtue of monetary action; this is no gentle hand on the steering wheel that keeps a well-driven car in its right place on the road."

It is, however, important to note that the Radcliffe Committee did recognise that monetary measures had influenced "confidence" in sterling. A rise in interest rates increased the attractiveness of holding sterling balances, and stern monetary measures were taken as indicative of the Government's intention to solve its problems without recourse to devaluation. In these ways, monetary policy contributed—for example in 1957 (see G10(1))—to the stemming of speculative outflows of sterling balances which threatened to impose heavy strains on our reserves. Many commentators feel that these effects provide an important justification for the use of certain forms of monetary controls.

5. ECONOMIC ASPECTS OF THE PUBLIC SERVICES.

The Cost of Public Services

In 1959 total public expenditure—excluding expenditure by nationalised industry—was £7,833 million, about £150 per head. Some of

* Food and agricultural subsidies (£395 million in 1952, and £343 million in 1959) are not counted as social services, since in 1959 their primary purpose was to support British agriculture rather than to cheapen food.

the details are shown in the table. Twelve per cent went on paying interest on debt, and 21 per cent on military and civil defence. The social services accounted for nearly half the total, leaving 21 per cent for the remaining services—police, roads, foreign and commonwealth services, tax collection costs, etc. Most of the expenditure was directly incurred by the Government, but £2,028 million represented expenditure by local authorities—nearly half of it on education—and £1,038 million expenditure out of the National Insurance funds on pensions and other benefits under the National Insurance Scheme. Both local authorities and the National Insurance funds are partly financed out of grants from the Central Government, which collects in taxes considerably more than it spends itself

Taxes covered 70 per cent of expenditure, and rates levied by local authorities another 9 per cent The rest was covered by the compulsory National Insurance contributions and by other income of various kinds Overall there was a rough balance between expenditure and receipts, although if one includes the capital expenditure of nationalised industries, which is also financed by the Government, there would be a large net deficit, *i e*, public authorities as a whole are big borrowers from the private sector of the economy

Since 1952 total public expenditure has risen by a third, but there has been a fairly steady decline in the ratio of public to private expenditure—accompanied by a steady fall in the proportion of the national income taken in taxes In 1952 taxes (including rates) amounted to 29½ per cent of total expenditure, public and private, by 1959 it had fallen to 26 per cent The main cause has been the sharp fall in the real load of defence expenditure, the total bill for defence has scarcely changed, even though prices and Forces' pay rates have gone up sharply This has allowed the cost of the main social services to rise substantially, housing is down, and so are food subsidies, but the cost of education and of pensions have risen sharply Another sharply rising element was roads, expenditure on which more than doubled during the period.

Public Housing.

Housing expenditure consists of two quite different items. The first, housing subsidies, is a current cost, and represents the difference between the cost of housing, including the cost of borrowing, and rents received on council housing In 1959 costs exceeded the rents of £196 million by £116 million, so that the average council-house tenant was paying about 13*s* in the £ of the cost of his house Most of the balance was borne by the Central Government, as up to 1957 the Government contracted to pay a flat subsidy per year on every council house built From then onwards government subsidies have been confined to houses built in connection with certain specific schemes—largely in connection with slum clearance The ordinary new council house receives no government subsidy, although some local authorities continue to subsidise new housing out of the rates, but the subsidies continue for housing built before the general subsidy was withdrawn

The other part consists of the capital cost of building new houses—£252 million in 1959 This is financed out of borrowing by local authorities Until 1953 local authorities borrowed from the Central Government through the Public Works Loan Board, but from 1956 onwards they have been increasingly forced to borrow from the market, and in 1959 repayments to the Central Government in respect of past loans exceeded new borrowing by £34 million This practice was criticised by the Radcliffe Committee, who found that much of the borrowing was very short-term, but the Government did not modify its policy

The two policies of cutting subsidies and making borrowing more difficult have sharply cut council housing. In 1953, the peak year, councils built 239,000 houses, in 1959 only 125,000, and in England and Wales private building now exceeds council building in the ratio 3 : 2. In Scotland, however, general housing conditions are far worse—in 1951 over half the households had three rooms or less, as against 15 per cent in England and Wales—and council house-building there still exceeds private building by 5 : 1.

Housing and Rent Control.

Most households still live in privately owned houses Council house-building began on a large scale only after the First World War, and there are about 5 million houses left from before that date These are the main houses covered by rent control Most of these are still controlled in rent, but the Rent Act of 1957 sharply increased permitted rents, unless the tenant could obtain a certificate of disrepair. Only the more expensive ones were decontrolled, although the provision of the Act that control ceases whenever the existing tenant dies or quits means that a steadily increasing proportion of the cheaper ones become decontrolled as time passes The main stated aim of the Act was to make ownership of houses for renting profitable once more, so that landlords would have an incentive to do repairs and make necessary improvements Another aim was to encourage the better utilisation of existing houses by encouraging those who had more space than they needed to make room for those who had more need of it But the most immediate consequence was a sharp rise in the cost of housing (see table on G24)

Education

Education and child care cost £921 million in 1959, 93 per cent more than in 1952 The main cause of the increase has been the sharp rise in the school population, which has risen by nearly a million pupils since 1952 The primary school population reached a peak in 1957, as the children born soon after the war, when the birth-rate was high, reached the schools, but the peak in the secondary school population will not be reached until 1963 (*See* E 2) As a secondary school pupil costs much more to educate than a primary school pupil—the ratio of pupils to teachers is 31 in primary schools and 21 in secondary schools—the prospects are for a continuing sharp rise in the early 1960s And after that will come the turn of the Universities, who have just begun on their expansion scheme to cope with the bulge Nor, when the bulge is past, is there much prospect that the pressure will relax The needed reforms as laid down in the Education Act of 1944—smaller classes, raising the school-leaving age to 16, getting rid of the gaunt Board Schools inherited from the Victorian era, raising the standards in the secondary modern schools to something nearer parity of esteem with the grammar schools, setting up County Colleges for compulsory further education—will all be very expensive, but to this expenditure, though not to any exact timing, both political parties are committed

The main task of providing education falls on the local education authorities, in England and Wales 91 per cent of children go to schools maintained by such authorities and only 2 per cent to schools receiving direct grants from the Ministry of Education They also pay most of the maintenance grants to University students, although the costs of the grants to the Universities themselves are paid by the Treasury But until April 1959 the Central Government paid most of the cost, as it paid the whole cost of teachers' salaries and half of most other items Since then the system of grants has changed, the Government has abolished most of the specific Exchequer grants towards particular services, but sharply increased its general grants to local authorities for them to spend as they think fit. The first general grants were fairly generous, but educationists have complained that, since under the new system any additional expenditure has to be financed entirely out of rates, anything but the minimum level of expenditure will be discouraged.

Social Security.

Social security benefits come from two sources The larger part, £990 million in 1959, is paid out of the National Insurance and Industrial Injury Funds. These funds, which are administered by the Ministry of Pensions and National Insurance, are built up largely out of the compulsory weekly National Insurance contributions which most of the adult population have to pay. For employees both employer and employee pay a contribution, in return for which employees receive rights to pensions, sickness, unemployment, and other

benefits. The self-employed also pay contributions of smaller size than the sum of the employer's and employee's contribution, and are not entitled to unemployment and one or two other benefits And most non-employed persons, other than married women and the retired, have to pay still lower contributions, and are entitled to even fewer benefits. Weekly contributions include a contribution to the cost of the National Health Service The remaining part of the contributions in 1959 covered 75 per cent of the costs of benefits and administration, grants from the Government 20 per cent, and interest on accumulated funds 6 per cent, leaving a net surplus of a mere £19 million

The most costly benefit is the retirement pension; that and the widows' and guardians' benefit, with nearly 6 million recipients, account for 73 per cent of the cost of all benefits, and exceed the cost of unemployment benefit by 14 to 1. A list of the other benefits is shown in the table Of the 6 million recipients, 1 million are also in receipt of supplementary grants from the National Assistance Board, whose grants are, like war pensions and family allowances, financed directly by the Government There are also a few non-contributory pensioners left, who were not covered by the contributory schemes first introduced in 1925, two in three of them also receive supplementary grants

The pension is paid as of right on retirement. Individuals may increase their rate of pension by staying on at work after the minimum retiring age of 65 for men or 60 for women, but the number who do so for more than a year is small—partly, but probably not mainly, because most private superannuation schemes lay down a fixed retiring age. Assistance grants, on the other hand, are given only on proof of need after a test of means The high number of supplementary grants shows that the statutory pension remained below what the National Assistance Board regards as the minimum acceptable standard, and it was partly to improve the pensions of those able to afford higher contributions that the scheme for graduated pensions was introduced

The Finance of Social Security.

The financial problem, however, has been important. The National Insurance Scheme is an odd mixture of insurance and tax. The levels of contributions, when the scheme started in 1948, were fixed on the actuarial principle that contributions by or on behalf of an individual *plus* a specified State contribution should on average suffice to pay for the benefits to which he was entitled. But the scheme did not allow for inflation, and a succession of increases granted in the rate of pensions has put an end to this actuarial probity. Whenever a bill is introduced to increase pensions, the Government Actuary calculates by how much contributions should be raised in order that those who contribute throughout their working lives at the new rates would just earn their right to the new benefits, but the new rates of pensions are granted to all, including those who have already retired. It was always calculated that as the number of retired persons grew the fund would move into deficit, but with each rise in pensions the estimated size of the future deficit has risen. The scheme for graduated pensions also had the objective of reducing this deficit.

Graduated Pensions.

Under this scheme, which affects only employees, there will be two kinds of workers - contracted-in and contracted-out Contracted-out workers continue under the old scheme, with the difference that their employer (on whom the decision whether to contract out rests) must institute a private superannuation scheme that gives at least as favourable terms as the new State scheme, including the provision that rights under the scheme should be transferable up to the limits of the State scheme. Transferability is the guarantee that the individual does not lose his pension rights when he changes his job, and one unsatisfactory feature of the private schemes that have existed has been their use to tie employees to their jobs Contracted-in workers come under a new scheme, under which the weekly National Insurance contribution depends on earnings Those earning less than £9 pay a flat-rate contribution, which is lower than that paid by contracted-out workers Those earning more than £9 pay in addition a percentage of the amount by which earnings exceed £9 up to a limit of £15, and in return receive the right to an increased pension on retirement.

PENSIONS, BENEFITS, AND ASSISTANCE GRANTS IN 1959

	1,057		
Net surplus	19		

The scheme is devised partly to encourage private superannuation, which is still largely confined to salaried employees *plus* employees of the State. But one purpose is clear, in return for a promise of higher pensions when they retire, most workers who are contracted-in pay more now and thus contribute now to the cost of the pensions of the retired. The estimated deficit is eliminated, and indeed the principle is established that the basic rates of contributions should not be fixed on acturial principles but on the principle that on balance benefits paid in a year should roughly balance receipts. No provision was made for automatically increasing pensions as the cost of living goes up or indeed as the average standard-of-living rises, all changes in rates of benefit still require a new Act of Parliament.

The Budget.

Most public services are paid for currently, whether by National Insurance contributions taxes, rates, or out of government income from the Post Office and other sources. Most of this income and expenditure passes through the Budget, which is divided into two parts. "Above-the-line" items refer to current receipts from taxes, etc., and current government expenditure. The latter is lower than total current public expenditure, as it does not include expenditure by the National Insurance Fund or by local authorities, except in so far as these are financed by government grants. The normal practice is for receipts to exceed expenditure by a considerable margin, in 1959/60 the surplus was £386 million in a total revenue of £5,630 million.

A list of the main taxes is shown in the table. Forty per cent of the total revenue comes from income tax, which is levied both on individuals and on the undistributed profits of companies, and other taxes on incomes and profits raise the proportion to nearly half. The next biggest revenue-raiser is the tobacco tax; tax multiplies the price of cigarettes and tobacco by over 3¼ times, and the receipts from this one tax could pay for half of defence or all the health services. Taxes on no other goods even remotely approach this level. On drinks they add under two-thirds to the cost, and on private motoring and radio and electrical goods less than one-third. On food and fuel taxes are negligible, and on clothing under 5 per cent, and on most other goods they add somewhat over 10 per cent.

The Budget Surplus.

In 1959–60 the "above-the-line" surplus was £386 million. There is always such a surplus on current account, though in 1952–54 it was very small, but except in 1949–51 when the "above-the-line" surplus was very large, the deficit "below-the-line" makes the Government a net debtor. In 1959–60 expenditure "below-the-line," which is expenditure on capital account, exceeded receipts by £700 million, largely owing to the voracious demands for capital of the nationalised industries. Such demands are now met directly out of the Exchequer, up to 1956 all the nationalised industries other than the National Coal Board raised the capital they needed by issuing government-guaranteed securities. The change has, however, partly been balanced by driving the local authorities on to the market instead, so that in 1959–60 they were actually repaying debt to the Government.

BUDGET SURPLUSES AND DEFICITS
(£ million)

	Surplus above-the-line	Deficit below-the-line.	Overall surplus (+) or deficit (−)
1949–50	549	486	+ 63
1950–51	722	473	+249
1951–52	380	529	−149
1952–53	88	524	−436
1953–54	94	391	−297
1954–55	433	500	− 67
1955–56	397	538	−141
1956–57	290	621	−331
1957–58	422	635	−213
1958–59	377	559	−182
1959–60	386	700	−314

Deciding on the overall surplus to aim for is the Chancellor's most difficult task when drawing up his Budget. A large deficit is inflationary, sometimes that may be required (as in 1952–53 or 1959–60) to get the economy out of a recession. A small deficit—and even more a surplus—is deflationary, and can, as in 1950–51, make a substantial contribution to holding an inflation in check. But the calculation of the precise deficit or surplus needed is a chancy business, for the level that is required depends on the amount of saving and on the amount of spending out of credit that people intend to do—and this is not easily predictable. It also depends on the change in the foreign balance. Nor can the Chancellor be sure his figures are right, estimating next year's revenue, and even next year's expenditure, by the Government is difficult enough, but he needs in deciding on his surplus to estimate not merely these but also the likely trends of private incomes and expenditure, without really reliable information as to what they were in the past year. So it cannot be expected that fiscal policy alone

can prevent inflation and deflation—even if the Chancellor could ignore, as he cannot, the likely effects on prices and savings of any changes in taxes he may make. Nevertheless, fiscal action—running large deficits when economic activity is low, and small ones when it seems to be excessively high—is the most important action through which the economy can be kept on an even keel Monetary policy may help, but the decision the Chancellor takes each April about his surplus is the kev one.

6. SOURCES OF STATISTICS, AND SOME SUGGESTIONS FOR FURTHER READING.

The non-specialist will find that most of the statistics he needs are given in the *Annual Abstract of Statistics*, published every year by Her Majesty's Stationery Office This comprehensive document includes figures on population, social conditions, education, labour, production, trade and balance of payments, national income and expenditure, wages and prices, and many other topics For more up-to-date information, reference should be made to the *Monthly Digest of Statistics* which has a similar coverage and gives month-by-month figures A selection of the more important series, presented in a manner which can more easily be understood by the layman, is given in another Stationery Office publication, *Economic Trends*, also issued monthly

Even greater detail is given in various other Government publications. The most important of these are the Blue Book on *National Income and Expenditure*, published annually; and the *Balance of Payments* White Paper, published twice a year. Both these are extremely valuable sources of information for the economist, but are difficult for the layman Fuller information on labour problems is given in the *Ministry of Labour Gazette*, and on trade in the *Board of Trade Journal* Unlike all the other statistical sources mentioned these latter two include discussions of the statistics presented

For an analysis of developments in the economy, the reader is recommended to the official *Economic Survey*, published every year just before the Budget It contains a survey of the economic events of the previous year, and some discussion of prospects in the current year, and it is written in such a way as to be comprehensible to the ordinary reader who has some background knowledge of economics Rather more technical is the *Economic Review*, a private publication issued by the National Institute for Economic and Social Research And the weekly newspaper *The Economist* will keep the reader up-to-date with economic developments For more general background reading, the reader might wish to refer to Shonfield, *British Economic Policy since the War*, published by Penguin Books, to *Growth in the British Economy* by Political & Economic Planning, published by George Allen & Unwin, and to Worswick and Ady, *The British Economy in the Nineteen-fifties*, published by Blackwell

III. DEVELOPMENTS IN THE BRITISH ECONOMY SINCE 1960.

1. INTERNATIONAL DEVELOPMENTS

The Balance of Payments.

Following an exceptionally favourable year in 1958—when a substantial current surplus was more than sufficient to finance the deficit on long-term capital transactions—the balance of payments deteriorated in 1959 There was a further sharp deterioration in 1960, in which year the current account deficit was over £300 millions, and the deficit on current account *plus* long-term capital account was nearly £500 millions· this was easily the worst year since 1951. Thereafter, there was a marked improvement in both 1961 and 1962, though even in 1962 the current account surplus fell very far short of the £300–£400 million surplus which is considered desirable.

(i) The Current Account.

It is clear from the table that the deterioration in the current balance of payments of well over £400 million between 1959 and 1960 had two causes: a sharp increase in the deficit on visible trade, and a sharp reduction in the surplus on invisible trade The increase in the deficit on visible trade was, in turn, mainly attributable to an increase of nearly £500 million in imports exports also increased, but not by enough to pay for the increased imports As the prices of imports hardly changed, the increased import bill reflects the import of a larger volume of goods than in any previous year Some part of the increase in imports was probably due to the measures of import liberalisation in 1959 and 1960, but the main cause was the upsurge in demand and production in 1959–60 During this upsurge, production capacity at home became strained, and some goods were imported to supplement home supplies Stocks of imported goods were run down in 1959, and were replenished in 1960 And higher incomes meant greater demands for imported goods These developments might be interpreted as indicating the adverse effects on

* Mainly because of changes in the definitions used in official balance of payments statistics, the figures for 1959 differ from those given in Part II.

† Excluding the subscription to the International Monetary Fund.

the balance of payments of internal expansion No doubt imports will increase as the economy expands, but it can be argued that sudden and very rapid bursts of expansion, as in 1959–60, will have a much greater impact on imports than would a steadier and more sustained growth

In the following two years, imports were steady at about the 1960 level—the internal economy was relatively stagnant, partly because restrictive measures (see below) had been adopted to curb demands at home and protect the balance of payments. Meanwhile there was a slow increase both in the prices and in the volume of goods exported, so that the deficit on visible trade in 1962 was smaller than it had been in 1959

The other source of deterioration between 1959 and 1962—the decline in the invisible surplus—is probably more permanent This surplus had exceeded £300 millions in the early and middle 1950s, and had then declined There were several contributory factors a sharp rise in Government overseas expenditure, a fall in the net earnings of interest, profits, and dividends, and the emergence of a sizeable deficit on shipping services Although there was an increase in the surplus on invisible trade in 1962, it would probably be unrealistic to anticipate a recovery of invisible earnings to anything like the levels of a decade ago. It follows that if this country is to earn a satisfactory current account surplus, it will have to earn a surplus on visible trade In general, it would be best to secure such a surplus through a faster increase in visible exports. but if a sufficient increase does not occur, some commentators would prefer to restrict imports by tariffs or physical controls rather than through a restriction of demand and output in the home economy

(ii) Flows of Long-term Capital, and Monetary Movements.

In most recent years, the deficit on long-term capital transactions has been of the order of £200 millions. This deficit represents the excess of the amounts we lend, invest, and re-invest abroad (mainly in Commonwealth countries) over the corresponding amounts lent, invested, or re-invested by foreigners in this country The surplus recorded in 1961 was highly exceptional Receipts of a special nature—including the investment of £131 million by the Ford Motor Company of America for the purchase of shares in the Ford Motor Company factory in this country—amounted to over £220 millions These special transactions apart, it appears that the outflow on long-term capital account was running at a " normal " rate in 1961. In 1962, however, there was a slackening in the outflow the deficit was less than £100 millions.

Any deficit on long-term capital transactions, together with any deficit on current account, has to be financed either by increasing our short-term liabilities to foreigners, or by reductions in our assets In 1960, nearly £500 million had to be financed, but the deficits on current account *plus* long-term capital account were very small in both 1961 and 1962 Oddly enough, the financing of the huge 1960 deficit did not raise any immediate problems, for there was a very substantial flow of short-term funds into this country (*i e* additions to our short-term liabilities) The sterling balances of sterling area countries fell by over £200 million during 1960, but this fall was more than offset by an unprecedented increase of over £600 million in the sterling balances held by non-sterling area countries The major cause of the inflow during the second half of the year was a speculation against the dollar, based on fears that it might be devalued So great was the inflow that there was a curious combination of a very large deficit on current plus long-term capital account and a substantial *rise* in our reserves of gold and convertible currencies

The dangers inherent in the financing of deficits through additions to short-term liabilities were vividly demonstrated in the following year Many of the funds which moved in during 1960 were moved out again before July 1961 in a wave of speculation against sterling. The outflow was financed partly by running down reserves of gold and convertible currencies by £280 million between end-1960 and July 1961, and partly through the " Basle agreement " under which European central banks undertook to build up short-term holdings in centres (London in this case) from which funds were being withdrawn. These Basle credits amounted to £250–£300 million by July 1961. The rapid drain on the reserves had to be stopped, and the European central banks were not prepared to see their sterling holdings rise much higher So in July 1961 a series of crisis measures—including the raising of Bank rate to 7 per cent—were taken, primarily to protect sterling In addition, arrangements were made to draw no less than £536 million from the International Monetary Fund (*see* **G11**) with provision for further credits if necessary Some of this drawing was used to pay off the " Basle " holdings, and the remainder was added to Britain's reserves of gold and convertible currencies Partly for this reason, and partly because funds began to flow back into this country in the second half of the year, there was a modest increase in the reserves of gold and convertible currencies over 1961 as a whole

In 1962, speculative movements of funds were much less violent Aided by a substantial improvement in the current balance of payments, this country was able to make substantial repayments of its IMF drawing In July 1962, just one year after the drawing had been made, repayments were completed These repayments did, however, involve a drain on our resources of gold and convertible currencies, and chiefly for this reason there was a substantial fall in our reserves over the year

In order to increase the resources available to neutralise the massive movements of short-term funds which had so disrupted balance of payments in 1960 and 1961, the IMF initiated a scheme for a " lenders club " In December 1961, the participating countries—including most major trading nations outside the Communist bloc—agreed to an arrangement whereby they undertook (subject to some control by lending countries over the use to be made of the funds) to make available loans totalling about £2,140 millions to the IMF for re-lending to countries suffering an outflow of short-term funds It should now be possible to minimise the disruption caused by speculative movements of funds from one financial centre to another.

The Common Market.

(i) Britain's Application for Membership.

On 31 July 1961, Mr Macmillan announced that Britain would apply for full membership of the European Economic Community, otherwise known as the Common Market The European Economic Community (EEC) consists of six full members—Belgium, France, Holland, Italy, Luxembourg, and Western Germany The full members ratified the Treaty of Rome in 1958 The Treaty provides for the progressive elimination of tariffs on trade between members, a common agricultural and commercial policy, a common external tariff on goods imported into the Community, and some integration of fiscal and monetary policies In addition to the full members, there are several associate members—chiefly Greece and former French colonies in Africa The associate members have more limited rights and obligations under the Treaty of Rome Britain had participated in the negotiations which led up to the Treaty of Rome, and had argued in favour of a looser " free trade area " without a common external tariff, and excluding trade in agricultural products. No compromise acceptable to the six countries which favoured a tighter economic union was found, and Britain joined with six other European countries—Austria, Denmark, Norway, Portugal, Sweden, and Switzerland—in forming the European Free Trade Area (EFTA).

There were obvious disadvantages in a division of Western Europe into two trading groups. Following a lengthy re-appraisal of its European policy, the British Government came to the conclusion that the best course of action would be to apply to join the Common Market In announcing the British application, the Prime Minister made it clear that there were three main problems which would have to be resolved in the negotiations The first two—the trading links with Commonwealth countries, and the position of British agriculture—were those which had influenced the British attitude in the earlier negotia-

tions. The third—our obligations towards our trading partners in EFTA—derived from the arrangements which had been made when the earlier negotiations broke down. The Common Market countries welcomed the British application, but made it clear that renewed negotiations must take place within the framework of the Treaty of Rome. There was an understandable feeling that the six countries had taken considerable risks in committing themselves to the Treaty. In terms of the growth of production and trade of the six, the Common Market had proved successful and no country was prepared to allow this success to be undermined through the admission to membership of a country which was not willing to accept the principles of the Treaty of Rome.

(ii) The Negotiations.

The British delegation for the negotiations on the British application for membership of EEC was led by the Lord Privy Seal, Mr Heath In an important policy statement on 10 October 1961, he made it clear that Britain had abandoned its advocacy of a loosely-organised free trade area "In saying that we wish to join the European Economic Community, we mean that we desire to become full, wholehearted and active members of the European Community in its widest sense and to go forward with you in the building of the new Europe" Furthermore, Britain "accepts without qualification the objectives laid down in Articles 2 and 3 of the Treaty of Rome, including the elimination of internal tariffs, a common customs tariff, a common commercial policy " Having accepted the Treaty of Rome as the basis of negotiations, he went on to suggest the ways in which Britain's special problems could be resolved

Most of the proposals were designed to limit the impact of British membership of the Common Market on the trading position of Commonwealth countries The Commonwealth consists of a very diverse group of countries, with very different patterns of trade, and for this reason Mr. Heath's proposals had to deal with a variety of problems For the underdeveloped countries of the Commonwealth, two lines of approach were suggested One involved granting these countries the status of "associated territories", which would give their products access to European markets on preferential terms There was a precedent for this sort of arrangement, in that France had already negotiated associated status for some of its former colonies in Africa. But it was recognised that the six might not be prepared to offer associated status to some of the larger underdeveloped countries in the Commonwealth—*e g* India, and that some countries might wish to reject an offer of association for political reasons As an alternative, therefore, it was suggested that the Common Market external tariff on some of the more important agricultural exports from these countries—*e.g* Indian tea—should be reduced or eliminated; and that arrangements should be made to ensure that the external tariff on manufactured goods exported from these countries—*e g* textiles from Hong Kong—did not lead to a reduction of such exports. For the more developed countries of the Commonwealth, there were proposals that the Common Market external tariff on raw material imports should be reduced or eliminated for certain Commonwealth-produced materials, such as aluminium, zinc, and woodpulp. It was also proposed that special arrangements should be made with respect to foodstuffs—chiefly meat, wheat, and dairy products—produced by developed members of the Commonwealth. The principle underlying these arrangements, it was suggested, should be that the Commonwealth producers "be given in the future the opportunity for outlets for their produce comparable to those they now enjoy".

For British agriculture, Mr Heath proposed that the "transitional period"—that is to say, the period allowed for adjustment before British agriculture became fully integrated into the Common Market agricultural arrangements—should be a long one, possibly 12 to 15 years from the date of joining the Common Market By contrast, it was not proposed to negotiate for favourable conditions for British industry. on joining the Common Market, Britain was prepared to make a reduction in her tariffs equivalent to the reductions which had already been made by the six original member countries.

Following this policy statement by Mr. Heath, detailed negotiations began in earnest For several reasons, the progress of the negotiations was slow. Each group of problems had to be broken down into its constituent parts, and a vast mass of facts, figures, and forecasts assembled so that the implications of particular decisions could be studied Furthermore, extensive consultation had to take place at each stage of negotiation Thus the six member countries had to confer amongst themselves in order to decide what concessions or modifications would be acceptable and since the interests of the six countries often diverged, there was sometimes hard bargaining to be done before the decisions were reached Britain had to consult with Commonwealth countries, in an attempt to allay the loudly-expressed suspicions that their interests were not being adequately considered Consequently, both sides appeared inflexible at the negotiating table, in that neither was able to move beyond its prepared brief without a further round of "internal" discussions

Nevertheless, by the spring of 1962, discussions on the terms of British entry were sufficiently advanced to justify hopes that a draft agreement could be negotiated in the summer This draft agreement could then be put before Commonwealth ministers at a meeting in September, and a final agreement on entry terms reached before the end of the year As the discussions continued some progress was made on the British requests for zero or considerably reduced tariffs on products important in Commonwealth trade—few decisions were announced, but it seemed clear that some compromise on the remaining products would emerge in a final phase of bargaining It was agreed in principle that Commonwealth countries in Africa and the West Indies should be offered associated status on the same terms as the ex-French territories It was agreed that the problems of India, Pakistan, and Ceylon could best be solved by trade treaties negotiated between the Common Market and these countries And it was agreed that a long-term solution for the problems of temperate foodstuffs could best be secured through world-wide commodity agreements

It had been expected that the problems of temperate foodstuffs would prove the most intractable and this expectation was fully justified Although Britain accepted the principle of a long-term solution through world-wide commodity agreements, she was naturally not prepared to accept that an undertaking that efforts would be made to secure such agreements by 1970 was adequate. She wanted specific arrangements to ensure that Commonwealth-produced temperate foods would be able to find markets in Europe in the period before 1970, and to make provision for special agreements with Commonwealth food producers if satisfactory world-wide commodity agreements could not be negotiated On these points, the negotiations on British entry ran into serious trouble France made it clear that she envisaged a reduction of food imports into Common Market countries, to permit an expansion of her agricultural output this point of view was clearly incompatible with British proposal for "comparable outlets" for Commonwealth producers In the end, no agreement on temperate foodstuffs could be reached before the negotiations were adjourned in August and there was therefore no draft agreement to put before the meeting of Commonwealth ministers in September.

At this meeting, Commonwealth ministers expressed grave misgivings about the course of the negotiations, but accepted that the decision on whether or not to join rested with Britain The African members of the Commonwealth, moreover, confirmed that they would reject any offer of associated status a status which appeared to them to carry undertones of "colonialism". Mr. Macmillan stated quite clearly that it was Britain's intention to join the EEC if the outstanding problems could be satisfactorily resolved

This firmly-expressed statement of intention may well have given the impression that Britain was now so committed to joining the Common Market that she would have to give way on most

of the outstanding issues. So there was some disillusionment when negotiations were resumed in November, and it was found that Britain was no more willing to give way than she had been in August. Indeed, the rejection of associated status by African Commonwealth countries, and the consequent need to protect their interests in other ways, added to the list of topics to be negotiated. As the form of longer-term solutions to virtually all problems had already been accepted by both sides, negotiations concentrated on finding solutions to transitional problems, and specifying more closely the nature of the longer-term solutions. In the first category fell the negotiations on transitional arrangements for British agriculture. The British wished to taper off the present system of deficiency payments to agriculture during the transitional period, whereas the six insisted that deficiency payments should be stopped immediately on entry. In the second category fell the negotiations on the content of the trade agreements with Asian members of the Commonwealth. Straddling both categories were negotiations on transitional arrangements for Commonwealth food producers, and on the content of the world-wide commodity agreements to be negotiated at a later stage. On these issues, the six wished to avoid any specific commitments on future policies, whereas the British were seeking specific commitments.

(iii) The Breakdown of Negotiations.

From November 1962 onwards the negotiations made little apparent progress, and it was noticeable that the French were adopting a very intransigent attitude. Nevertheless, it was the opinion of many observers that by January 1963 the stage had been set for a final round of bargaining, and that given good-will on both sides Britain's entry could have been assured. It therefore came as a surprise, not only to Britain but also to the other five members of the Common Market, when France demanded that the negotiations be broken off. Despite opposition from the other five, the French demand was accepted, and the British negotiators returned empty-handed. Perhaps the fundamental reason for the breakdown can be inferred from a statement attributed to General de Gaulle: "the Europe I prefer is the Europe of the Six."

(iv) Alternatives to the Common Market.

The failure at Brussels has stimulated a considerable debate on the economic policies which should be pursued in this country. There is general agreement that a substantial revision of policies is necessary to lift the economy out of its rut of slow growth, and to contribute to a healthier balance of payments position. As regards external policies, some suggest that we should redouble our efforts to secure a reduction in restraints on trade through further reductions in barriers on trade within the European Free Trade area, and by vigorously supporting GATT (*see* G10) in its efforts to secure multilateral reductions in restraints. More extreme is the suggestion that we should lower our tariffs unilaterally, even if other countries do not lower theirs. Lowering our tariff barriers will, it is argued, contribute to efficiency by subjecting industries in this country to stiffer competition, and if barriers abroad are reduced, this will aid our exporters. By contrast, others suggest that we impose greater restraints on imports, so that efforts to increase the rate of growth in this economy should not be unduly hampered by balance of payments difficulties. Yet others take the view that sterling should be devalued, in order that exports should be encouraged by making them cheaper to foreigners, and imports discouraged by making them more expensive to residents. A variant of this view involves the suggestion that sterling should be allowed to float, *i.e.* that the exchange rate should be permitted to fluctuate over a wider range than at present. There are advantages and disadvantages to each suggestion: and the debate continues.

2. INTERNAL DEVELOPMENTS.

Industrial Output and Employment.

In the last quarter of 1962, industrial production was about 15 per cent higher than it had been in 1958. The major part of this expansion occurred in the twelve months between March 1959 and March 1960. Over this brief boom period, industrial output increased by no less than 11 per cent. The boom had been preceded by three years of industrial stagnation, and, as the table shows, it was followed by a three-year period during which the increase in industrial output was slight. The numbers employed in industry were only 3 per cent higher at the end of 1962 than in 1958, so that productivity—output per person employed—rose by about 12 per cent over the period. Here again, a very high proportion of the increase was secured in the 1959 boom: productivity was already 10 per cent higher than in 1958 at the beginning of 1960, and the increase over the next three years was very small.

INDUSTRIAL PRODUCTION, EMPLOYMENT, AND PRODUCTIVITY, 1958-62

(Quarterly averages of seasonally adjusted index numbers, 1958 = 100)

		Industrial production (1)	Employment in industry (2)	Productivity in industry (1) – (2) × 100
1960	I	112	102	110
	II	112	102	110
	III	113	103	109
	IV	113	103	109
1961	I	113	104	109
	II	115	104	111
	III	115	104	111
	IV	113	104	108
1962	I	113	104	109
	II	116	104	112
	III	117	104	113
	IV	115	103	112

Restriction and De-restriction.

The early years of the 1960s have witnessed several changes in the emphasis of Government monetary and fiscal policies. In the first half of 1960, the emphasis was on restrictive policies both because of the deterioration in the balance of payments position, and because it was apparent that the very rapid expansion of output had created severe strains in the economy at home. No doubt there would have been a slowing down in the rate of increase in output even if restrictive measures had not been taken: an increase as rapid as that in 1959 was possible only because a substantial excess capacity had developed over the preceding years. But the measures taken to restrict the rate of growth of demand reinforced this tendency, and there was in fact little further increase in industrial output during 1960, despite a relaxation of restraints at the end of the year.

These relaxations did, however, help to stimulate some increase in output in the early months of 1961. But from July 1961—again primarily for balance of payments reasons—there was a phase of even sterner restrictions. The progressive relaxation of restrictions from the summer of 1962, coupled with measures designed to stimulate industrial output, had not had any major effect by the end of the year.

In some ways, the situation early in 1963 was analogous to that of early 1959. There was a substantial under-utilisation of capacity in many branches of industry, for investment had been high in 1960–62. Labour resources for expansion were available, in that unemployment was higher than at any period since the war. In these circumstances, vigorous expansionist policies—and in particular, an expansionist Budget—could be expected to result in another spurt in industrial output, and a substantial increase in productivity.

Regional Unemployment.

A particular problem which has become more acute recently is that of the high level of unemployment in certain regions of the country. In March 1963, the percentage of all workers unemployed

in Great Britain was 3 1, and the percentage of male workers unemployed was 3·8. But the table shows that a lower proportion of the male labour force was unemployed in the Midlands and the South, and that there was a much higher percentage of unemployment in the north, in Scotland, and in Northern Ireland.

PERCENTAGE OF MALES UNEMPLOYED, BY REGIONS MARCH 1963

London and South-East	2 4
South-Western	2 9
Eastern and Southern	3 0
North Midlands	3 0
East and West Ridings	3 1
Midlands	3 4
North-Western	4 4
Wales	4 9
Scotland	6 8
Northern	7 2
Northern Ireland	9 3 *

* Males and females

This problem can be tackled in several ways, but it cannot be pretended that there is any easy solution The Government can help by placing orders for the goods it needs—*e g* defence contracts—in these relatively depressed areas, it can try to induce expanding industries to set up new plants in these areas, it can make it easier—*e g* through re-training schemes—for labour to move out of these areas into areas where work opportunities are greater, it can authorise additional expenditure on public works—*e g* by accelerating road-building programmes—to provide additional employment. An indication of the Government's greater awareness of these regional problems was the appointment of Lord Hailsham to study the problems of the North-East General measures to expand the economy are necessary, but they must be supplemented by more specific measures to reduce the imbalances between different areas of the country

Planning for Faster Growth.

There has been an increasing dissatisfaction with the rate of growth achieved in this economy over the past decade or so The economies of most Common Market countries have increased their industrial output at a much faster rate Furthermore, there has been dissatisfaction with the way in which this economy has grown the characteristic pattern has been one of sharp bursts of expansion interrupted by rather lengthy periods of stagnation

To stimulate a more systematic study of the problems of securing a faster and more even growth in the British economy, the Government established the National Economic Development Council (NEDC) Its two-tier organisation is similar to that of the corresponding planning council in France The Council itself consists of representatives from the T.U C and employers' organisations, Government ministers, and independent members The Council is served by a group of experts under a Director-General. This group undertakes research into the problems of securing a faster rate of growth, into the means of overcoming obstacles to growth, and into the economic policies which could be most conducive to faster growth The reports and recommendations of the expert group are submitted to the Council, and if approved by the Council, are then published.

The first meeting of the Council was held in March 1962; the first reports of the Council were published less than a year later, in February 1963 The target for growth over the period 1961–1966 adopted by NEDC is to increase the output of the economy (technically, the gross domestic product at constant prices) by 4 per cent per annum. This is substantially faster than the rate of growth actually achieved in recent years: it implies that output will have to be 22 per cent higher in 1966 than it was in 1961. Part of this period has already passed: and the growth of output between 1961 and 1962 was probably less than 2 per cent. This means that the growth of output in the remainder of the period must be greater than 4½ per cent per annum if the target for 1966 is to be hit: a difficult task but, given the major under-utilisation of resources in early 1963, not an insuperable one

The NEDC estimates that the available labour force will rise by 4 per cent—or 0 8 per cent per annum—between 1961 and 1966. It follows that productivity will have to increase by 3 2 per cent per annum This, again, is a substantially faster rate of increase than has been achieved over past periods: but a faster growth of output should make it easier to secure a faster growth of productivity

The increase in output, and the need to increase productivity, will involve a substantial increase in investment expenditures In manufacturing industry the NEDC estimates that investment in 1966 would have to be 18 per cent higher than in 1961, but outside manufacturing (and particularly in electricity production) increases would have to be greater In all, it is estimated that investment at constant prices will have to be some 30 per cent higher in 1966 than in 1961—an increase of 5 3 per cent per annum over the period Expenditure by consumers, and by public authorities on goods and services, would have to rise rather more slowly—by 3½ per cent per annum at constant prices—but even these rates of increase compare favourably with those actually achieved in the recent past The NEDC does not, therefore, call for "austerity" with output increasing more rapidly, more goods and services will be available to the economy

In many ways, the crucial calculations are those concerned with the balance of payments The NEDC report supposes that imports will increase by 4 per cent per annum, and that to achieve a "satisfactory" surplus of about £300 million on the current balance of payments by 1966 exports would have to increase by 5 per cent per annum If such a rapid increase in exports is not achieved, the whole course of development as outlined in the report could be jeopardised, in that balance of payments difficulties might, as in the past, appear to justify policies to restrict the growth in domestic output Conscious of this problem, the report indicates that consideration should be given to possible policies which could make exporting easier and more profitable

A particularly interesting feature of the work of the NEDC is its studies of individual industries Seventeen major industries were surveyed in detail to assess the changes in output, employment, productivity, investment, and exports, which were feasible in each industry Planning at the level of national aggregates is inevitably a somewhat abstract exercise, and by relating planning at the national level to planning at the level of individual industries the NEDC is doing valuable work.

Wages and Prices.

Retail prices have continued to edge upwards in the early years of the 1960s by the end of 1962, retail prices were about 9 per cent higher than at the beginning of 1960 The table (**G39**) shows that none of this increase can be attributed to increase in import prices, which in fact fell slightly over the period But the contribution which lower import prices have made to lower retail prices has been more than offset by the effects of higher wages and earnings Between the beginning of 1960 and the end of 1962, weekly wage rates rose by 11 per cent, and total income from employment by no less than 18 per cent Since over the period the increase in productivity was very slow, the relatively rapid rise in employment incomes contributed towards an increase in costs per unit of output and therefore in prices One of the main dangers of this inflation of costs and prices is that exporters will find it more difficult to compete in foreign markets. The table shows that export prices in fact increased very slowly: but this may well imply that producers were having to accept lower profit margins on sales to export markets than on sales in the home market, and this does not encourage producers to push their sales in overseas markets.

Incomes Policy.

This is the background to the efforts which have been made, and are being made, to introduce some form of incomes policy which will restrain

PRICES AND WAGE-RATES 1958–62
(Index numbers, average 1958 = 100)

		Income from employment	Weekly wage rates	Retail prices	Import prices	Export prices
1960	I	109	104	101	101	101
	II	112	105	101	100	101
	III	114	106	102	99	101
	IV	115	107	103	100	101
1961	I	119	109	103	98	102
	II	121	109	104	99	102
	III	122	111	106	97	102
	IV	123	111	107	97	102
1962	I	125	112	108	97	103
	II	127	113	110	97	103
	III	129	115	110	96	103
	IV	129	116	110	97	104

increases in wages and other incomes in order to secure more stable prices at home and greater competitiveness in overseas markets

In July 1961, the Chancellor of the Exchequer called for a "pause" in wages, salaries, and dividend payments Exhortations for restraint had been a familiar feature of ministerial statements for many years but on this occasion the Government soon made it clear that it intended to use such power as it has to influence the amount and timing of wage and salary awards It has power to decide when the pay awards recommended by Wages Councils—which fix minimum wages for 3½ million workers—shall be implemented Although there were a few exceptions, the Government was on the whole successful in delaying Wages Councils awards until after the end of the pay pause in April 1962 The Government's power is strongest over workers which it, directly or indirectly, employs Two examples of the way in which it used this power can be given The Burnham Committee—the body which makes recommendations on teachers' pay—recommended an increase costing £47½ millions, but this was trimmed down to £42 million The work-to-rule of the Post Office Engineering Union was in protest against the witholding, for the period of the pause, of £1½ million of an award made by the Civil Service Arbitration Tribunal The Government can also expect to influence awards made in nationalised industries But the limitations on this power were indicated by a settlement in the electricity industry during the pause The award by the Electricity Council of a 5 per cent increase was condemned as inconsistent with the pay pause policy

The "pay pause" was envisaged as a temporary policy, and it is very difficult to assess its effects It certainly postponed some wage awards which would otherwise have been made in the pay-pause period, and it may have contributed to a stiffening of resistance to wage claims But this was achieved at the cost of some interference with established bargaining machinery, and, because the pause affected some groups of workers more severely than others, it may have suggested that any longer-term Government policies on wages would have a discriminatory impact

In February 1962, the Government issued a White Paper called "Incomes Policy· The Next Step" which outlined its views on income policy after the end of the pause It stated that "the objective must be to keep the rate of increase in incomes within the long-term rate of growth in national production. . In recent years, national production has risen by about 2 to 2½ per cent a year We ought to be able to do better than this but on present trends it seems likely to increase at about this rate in 1962 It is accordingly necessary that the increase of wages and salaries, as of other incomes, should be kept within this figure during the next phase" The Government conceded that there may be "particular circumstances" which might justify a greater than 2–2½ per cent increase in 1962, but emphasised that such increases should be exceptional, and argued that there will be other cases where a smaller increase would be desirable. It stressed that most of the arguments which had in the past been advanced in justification of wage or salary claims—for example, increases in the cost of living, trends in productivity or profits in particular industries, and comparison with levels or trends in other employments—should now be given less weight, and that what it refers to as "general economic considerations"—i e the increases which the economy can afford given the prospective rate of increase in national production—should be given more weight. In effect, the objective of the "next step" is a general scaling-down of increases in money incomes to a level which the Government considers to be compatible with price stability. The document did not, however, propose any specific policy or institutional changes

In July 1962, it was announced that the Government intended to set up a National Income Commission The terms of reference of this body were published in November It cannot participate in, or comment upon, wage claims whilst negotiations are in progress unless the parties involved agree, and as the T U C does not intend to co-operate with the Commission, such agreement is unlikely. It can be asked to report on inflationary settlements which have been reached (unless the settlement was reached through arbitration) but it has no power to cancel or modify an agreement. It can be asked to comment in advance on wage claims in the public sector (but not in nationalised industries), and even then only if the claims are not referred to other forms of arbitration It may further be asked to comment on profit levels

The first references to the National Incomes Commission were made in December 1962 They concerned the settlements reached for Scottish builders and plumbers, involving a reduction in the standard working week from 42 to 40 hours If the standard working week is reduced without a corresponding reduction in hours actually worked, the effect is to increase the number of hours worked at overtime rates, and thus to increase earnings and costs. In its evidence before the Commission, the Government affirmed that "concealed" earnings increases of the magnitude implied in these settlements were inconsistent with its incomes policy and reiterated its view that average wage increases should not exceed 2–2½ per cent One difficulty in the Government's position is that the proposals of the NEDC are based on a target for a rate of output increase which, if achieved, would permit a rather faster rate of increase in incomes without inflation, and its arguments for a slower rate of income increases might seem to imply that it does not consider the NEDC proposals realistic. But this may be a debating point, rather than one of real substance, for the rate of increase of wages and of incomes in recent years would have been too rapid for price stability even if output had been growing at the NEDC target rate If price stability is to be a policy objective, then it follows that the rates of increase in incomes should in some way (it has not become at all clear in what way) be reduced

Later the National Incomes Commission was asked to undertake a full-scale review of the way in which teachers in universities and colleges of advanced technology were paid; and in March 1963 another settlement involving a 40-hour standard working week—this time to workers in the electrical contracting industry—was referred to the Commission.

Monetary and Fiscal Policies since 1960.

In the first half of 1960, there were a series of restrictive measures designed to curb the increase in home demand and to improve the balance of payments position. The Bank rate was raised from 4 per cent to 6 per cent. To exert pressure on the banks' liquidity positions, and so help to curb bank advances, the banks were called upon to place special deposits (*see* G28(1)) with the Bank of England amounting to 2 per cent of their total deposits. Restrictions on hire-purchase transactions were reimposed. Finally, the 1960 Budget was much more restrictive than that of the previous year: whereas the Chancellor had estimated an overall deficit (*see* G33(2)) of £721 million for 1959–60, his estimated deficit for 1960–61 was only £318 million. The main features of this Budget were an increased profits tax and an increased indirect tax on tobacco.

Later on in the year, there was some slight relaxation of monetary policy. By the end of the year, Bank rate was down to 5 per cent. In the main, this reduction was made in an attempt to curb the inflow of speculative funds from abroad. In January 1961, hire purchase restrictions were eased: expenditure on consumer durable goods had been curtailed by the restrictions imposed in 1960, and this relaxation led to a recovery in the output of consumer durables. By contrast, the Budget of April 1961 was sternly anti-inflationary in that the estimated overall deficit was reduced to a mere £69 million. In effect, the Chancellor hoped to finance virtually all Central Government current and capital outgoings out of tax receipts. In this Budget, there was a further increase in profits tax, and an increase in some indirect taxes. Partially offsetting these increases, there was a major reduction in surtax. This reduction only affected persons with earned incomes in excess of £2,000 a year; persons living entirely on unearned income did not benefit.

In addition, the Chancellor was granted powers to introduce, if he considered it necessary, two economic " regulators ". The first was a pay-roll tax, to be paid by employers in respect of all employees on their pay-rolls, of up to 4*s* per employee per week. The second was a surcharge on, or rebate of, indirect taxes by up to 10 per cent. The power to introduce these regulators means that there is greater scope for using fiscal measures to influence the economy in the periods between Budgets.

In July 1961, at the time of the foreign exchange crisis, the Chancellor introduced the so-called " Little Budget ". This was not in fact a Budget at all, but a collection of restrictive measures. Some of these measures were primarily intended to ease the critical foreign exchange position. The Government announced that it intended to check the rapid rise in the overseas expenditure, to control private investment outside the sterling areas more strictly, to encourage British firms operating overseas to remit a higher proportion of their earnings to this country; and to make a large drawing from the International Monetary Fund. The Bank rate was raised from 5 to 7 per cent partly to make holdings of sterling more attractive to foreigners. Additional measures to check an expansion of home demand included a 10 per cent surcharge on indirect taxation (here the Chancellor used one of the " regulators " approved in the 1961 Budget), and a call to the banks to place a further 1 per cent of their gross deposits into special deposits at the Bank of England. Furthermore, the Chancellor announced that he aimed to restrict the increase in real Government spending in 1962–63 to 2½ per cent, and proposed a " pay pause " (see above).

These measures not only stopped the outflow of funds, but led to an inflow of funds to this country. £100 million of the IMF loan was repaid in October, and the whole of the loan was repaid by July 1962. As the foreign exchange situation improved, the Bank rate was gradually reduced to 5 per cent in March 1962. The measures were, however, perhaps too successful in restricting demand at home: for there was a fall in industrial output in the second half of 1961.

The Budget of April 1962 was, however, no less restrictive in intention that the 1961 Budget. The estimated overall deficit, at £74 million, was virtually unchanged. In this Budget, changes in direct taxation were slight; but a remarkably large number of changes in indirect taxation were introduced. The Chancellor withdrew the 10 per cent surcharge on all indirect taxes, but made changes in indirect tax rates so that the revenue from indirect taxes would not be reduced. In addition, there was a move towards a greater uniformity of purchase tax rates. Taxes on goods bearing high rates of purchase tax—*e g* cars and cosmetics—were reduced, and taxes on goods bearing low rates of purchase tax—*e g.* furniture and clothing—were raised. Purchase taxes were also imposed on some goods which had previously been free of tax—*e g* chocolate and ice-cream.

The main novelty of the 1962 Budget was a tax on speculative gains. If stocks and shares are bought and sold within a period of 6 months, any gain or profit on the transaction will be taxed as income. So will any gain or profit on purchases and sales of land and buildings (but excluding any gain from the sale of a house occupied by the owner) within a period of three years. These capital gains have not previously been subject to tax in this country. But any gains arising on stocks and shares held for longer than six months, or land and buildings held for longer than three years, will not be subject to tax.

From the summer of 1962 onwards, changes in monetary and fiscal policies were designed to stimulate an increase in economic activity. There was a good deal of surplus capacity in many industries, and unemployment was beginning to creep up. The Bank rate was further reduced to 4 per cent. Between May and December, all special deposits held by the Bank of England were released, and in October all qualitative restraints on bank lending were abolished. Also in October, the Chancellor released £42 million of post-war credits, and announced that there would be a substantial increase in public investment in 1963. In November, investment allowances for industry were increased, and the purchase tax on cars was reduced to 25 per cent. January saw further reductions in purchase taxes, and a very considerable increase in social security payments. All the main benefits (unemployment pay, sickness pay, pensions) were raised by 10*s* a week for single persons, and 16*s* 6*d*. for married couples. The annual cost of these increases will amount to no less than £227 million. In February, there was an increase in national assistance rates.

Despite these stimulatory measures, a substantial underemployment and unemployment of resources continued into the spring of 1963. In the April 1963 Budget, the estimated overall deficit for 1963–64 of £687 million was more than £600 million greater than the deficit estimated for 1962–63. This represented the biggest fiscal boost to the economy since the 1959 Budget.

Tax reliefs amounting to £269 million for 1963–64 were announced. The most important benefits to individuals were derived from increases in the allowances which can be charged against income before income tax is levied: there were increases in personal allowances, in the allowances for children, and in the allowances for National Insurance contributions. In addition, Schedule A taxes were abolished for owner-occupiers. These changes, by increasing taxpayers' disposable incomes, should stimulate spending on consumption goods and services. Most of the other changes in taxation were designed to stimulate investment spending by companies. Investment allowances (*see* G19) had already been increased in November: the Budget introduced provisions to permit an increase in depreciation allowances for tax purposes. Furthermore, companies which invest in areas of high unemployment will be permitted to charge depreciation on their assets at a rate of their own choosing, instead of being forced to charge depreciation at rates specified by the tax authorities. As a consequence, investment spending should become more attractive, especially in development areas.

Some critics of the Budget have regretted that no measures specifically aimed at the encouragement of exports were incorporated; and others have argued that there should have been an even larger boost to consumption spending. But though there is room for argument about the nature and magnitude of the changes announced, there can be no doubt that an expansionary Budget was appropriate to the condition of the economy in the spring of 1963.

Greek Myths and Legends

The ancient Myths and Legends of Greece
retold in the light of modern research,
and fully indexed.

TABLE OF CONTENTS

Greek Myths and Legends

PART I. INTRODUCTION

(a) The Significance of the Myths and Legends.

We all know how the stories and books that we knew in our youth have coloured our thought. So it is with the myths and legends of the earliest civilisation of Europe, that of the Greeks. Their stories have entered the stream of consciousness of European men and women through the ages, affecting their literature and art, and even their ways of thinking.

The Origin of Myths. True myth has been defined by Robert Graves as "the reduction to narrative shorthand of ritual mime performed on public festivals, and in many cases recorded pictorially." These rituals were, says Graves, "archaic magic-makings that promoted the fertility or stability of a sacred queendom or kingdom—queendoms having, it seems, preceded kingdoms throughout the Greek-speaking area."

The immense diversity of these myths is partly due to geographical causes, for, in the widely differing districts of Greece, different conceptions of the divinity and varying rituals of propitiation were evolved. There are also historical causes, for the Mediterranean peoples worshipping an earth goddess were conquered by successive waves of Hellenes bringing with them some form of tribal sky god.

Legends. Interwoven with the religious myths were a host of legends, traditional stories, which though not authentic had, like the tales of Troy, a substratum of fact. There were, also, all kinds of fables and anecdotes, folk-tales such as that of Perseus, and allegories and romances, which fused with the myths and legends to make a fascinating complex of stories.

Their Preservation in Literary Form. These have been preserved for us largely by the Greek poets, especially by Homer in his *Iliad* and *Odyssey*, and by Hesiod in his *Theogony*, works which probably date from about the eighth century B.C. The Greek dramatists of the fifth century B.C.—Aeschylus, Sophocles, and Euripides—who relied on myth and legend for most of their plots, also handed on the ancient tales, though often in slightly altered form. Then about five centuries later Roman writers, such as Virgil, Ovid and Horace, modelling themselves on the Greeks, refashioned and embroidered their themes. It is not surprising that we have so many variants of the same tale.

This rich and complex treasure of Greek myth and legend has become increasingly familiar in Western Europe, at first in Latin versions, then after the Renaissance in the original Greek, and today in excellent modern translations.

Their Significance Today. Because of their extraordinary vitality and pervasiveness, some familiarity with Greek myth and legend is almost indispensable to a full appreciation of our European culture.

In Art and Literature. Great painters like Botticelli, Veronese and Rubens made the ancient stories the subject of their pictures, and writers from Shakespeare to James Joyce have enriched their work by constant reference. The French dramatists from Racine to Giraudoux are notable for relying on them for the basic plot of their dramas. Today when good and inexpensive translations enable us to go direct to Homer's *Iliad*, or to see Euripides' *Medea* on the stage, it is especially useful to have some general knowledge of the mythical background to the particular epic or play.

Psychology. Not only to those who love art and literature is the knowledge of Greek mythology rewarding. Psychologists have found here suggestive symbols for the profound mental processes they are endeavouring to elucidate. Through Freud the term "Œdipus complex" is now a commonplace, and Jung has found in the myths symbolic archetypes of human response.

Philosophy and Religion. Philosophers also have found it profitable to return to the myths. Bertrand Russell emphasises the influence of Greek religion on Greek philosophy, and, through such philosophers as Pythagoras and Plato, on Christianity itself.

Anthropology. Of recent years anthropologists scrutinising the myths have been able to discern something of the way of life of primitive societies. The two-volume Penguin *The Greek Myths*, by Robert Graves, incorporates some of their interpretations.

Archæology. Perhaps the most exciting of all recent investigations are those of the archæologists working on sites once considered only legendary. The German Schliemann, trusting to the fidelity of his Homer, actually unearthed the foundations of Priam's Troy and Agamemnon's Mycenæ, finding fabulous treasure and proving to the astonished world that these antique tales were indeed rooted in fact. Through Schliemann's trust in Homer we have added an early chapter to History, that of the Mycenæan culture of pre-classical Greek which flourished from about 1550 to 1200 B.C.

Another centre of ancient story, the island of Crete, was the field of Sir Arthur Evans' enquiries, and his excavation of the magnificent Palace of Cnossos not only pushed back the frontiers of history yet further to about 3000 B.C., but also showed how many Cretan legends had some factual basis.

More recent excavations at legendary Mycenæan sites on the mainland have led to the discovery of the Palace of Nestor at Pylos, and the House of Cadmus at Thebes.

Tablets found at Mycenæan towns and in Cnossos inscribed in an entirely unknown script, "Linear B," have challenged scholars with a fascinating puzzle. After years of study Michael Ventris and others have at last been able to decipher the script. Although so far only inventories are available, it is significant that the language used is archaic Greek. We now know therefore that the Greeks of the Mycenæan age could write, and that Homer's single reference to writing is once more a faithful record

of fact. (See Book VI of the *Iliad* and the reference to Bellerophon's "folded tablet.")

(b) The Historical Background to the Myths and Legends.

Our knowledge of the earliest periods of Greek history is very recent. The great historian Grote, writing in 1846, said that we must consider the First Olympiad of 776 B.C. as the starting point. Anything earlier was matter for conjecture. It is largely due to the discoveries of archæologists that scholars are now able to push back the frontiers of history. From archæological evidence they can now reconstruct the probable course of events from as early a date as 3000 B.C.

3000 B.C. Early Bronze Age. It was about 3000 B.C., when the Neolithic Age was succeeded in the Eastern Mediterranean by the Early Bronze Age, that a bronze-using people, akin to those of early Crete and the Cyclades, entered Greece and fused with the Neolithic folk already there. These invaders were not Aryans, but of Mediterranean stock, and they worshipped the Great Goddess, a fertility goddess who appeared in many guises. She was unmarried, and in many instances her lover appeared to her in the form of a bird.

2000 B.C. Coming of Hellenes. A thousand years later, in the Middle Bronze Age a very different kind of people began to enter Greece. These were the Hellenes or Greeks, an Aryan people from the North, for whom transport and conquest were easy by reason of their horses and wheeled vehicles. Unlike their predecessors, they were patriarchal, and their chief divinity was a tribal sky-god, but as they fused with the pre-Hellenic stock already in the country, so their patriarchal worship mingled with the matriarchal and the sky-god married the earth-goddess.

Minyans and Ionians. Successive waves of these Hellenes invaded the country in three main groups beginning in about 2000 B.C. with Minyans and Ionians.

Minoan Culture. Penetrating far south to the islands, and to Sicily, Southern Italy, and Asia Minor, they became expert navigators. They were much influenced by a brilliant and sophisticated Minoan culture already flourishing in Cnossos in Crete, and this began to have considerable effect on the mainland of Greece from about 1580 B.C. onwards.

1400 B.C. Achæans. In about 1400 B.C., however, Cnossos fell, destroyed either by earthquakes or by invaders, for the Achæans, the second wave of Hellenes, had now begun to enter Greece, and from about 1400 to 1100 B.C. Mycenæ on the mainland was probably the centre of civilisation in the Ægean world.

Mycenæan Culture. It is this Mycenæan culture of the Late Bronze Age which, seen through legend, is depicted in Homer's *Iliad* and *Odyssey*. Mycenæ is Agamemnon's own citadel, and other cities where archæological remains are now being found are named in the *Iliad's* "Catalogue of Ships." The Achæans as Homer shows them were a conquering feudal aristocracy and a concerted attempt probably made by them in the beginning of the twelfth century B.C. to seize the Black Sea trade may be reflected in the epic of the siege of Troy.

1200 B.C. Dorians. But the Achæans themselves were soon to be defeated, for at the end of the twelfth century B.C. the last influx of invading Hellenes, the Dorians, ancestors of the classical Greeks, entered the country. They practically destroyed the Mycenæan civilisation, and the Late Bronze Age now gave way to the Iron Age.

The Olympian Divinities. The close fusion between the early non-Aryan Mediterranean people, with their matriarchal culture, and the successive waves of patriarchal Hellenes was reflected in the Greek worship of Olympians. The ancient earth-goddess of fertility lived on in such guises as Aphrodite or Hera, and Zeus, sky-god of the Hellenes, appropriately took Hera to wife. Indeed, many deities, such as Demeter or Athene, combined, in the single divinity, both Mediterranean and Hellenic traits.

A third element in Greek Olympian religion derived from a Hittite culture flourishing in Asia Minor in about 1300 B.C. which had developed from a Hurrian culture of about 1500 B.C. Hesiod writing in about 750 B.C., incorporated some violent Hurrian myths of the cannibalism of the gods, in his *Theogony* or *Birth of the Gods*.

The "Epic Cycle." By the eighth century B.C. there was in existence a rich store of myth and legend known as the "Epic Cycle," which was drawn on by Homer and also by later poets and dramatists.

Homer's Picture. Homer, whose epics were probably completed at the end of the eighth or in the seventh century B.C. presents the composite myth and legend of Greece in highly civilised form, as the beliefs of a successful war-like aristocracy. The twelve deities dwelling on Olympus acknowledged the supremacy of Zeus, and Dionysus the god of wine and ecstasy who entered from Thrace in the eighth century B.C. was still an outsider, a god of the lower orders.

The Coming of Dionysus. But by the fifth century B.C. Dionysus had been accepted as an Olympian, taking the place of Hestia. The growing popularity of his worship which induced an ecstatic union with the god in a frenzy partly stimulated by wine, partly mystical, shows the need of the recently civilised Greeks for an impulsive religious expression which was not always satisfied by the prudent cults of the serene Olympians.

Orpheus. From the worship of Dionysus developed that of Orpheus, which aimed at mystic union with the god through enthusiasm wholly mystic, and through purification. The Orphics, believing in the transmigration of souls and an after life, had much influence on the Greek philosopher Pythagoras, and this influence was transmitted through Plato into Christianity itself.

The great influence of Greek religion on philosophy has only recently been recognised, and Bertrand Russell commends especially the study of John Burnet's *Early Greek Philosophy*, especially its second chapter, "Science and Religion."

(c) Bibliography.

There is no one book or Bible of Greek myths. Many versions exist, and in a short account it is not possible to record all variations. The reader is advised to consult the masterpieces of Greek literature now available in translation.

(d) Guide to Pronunciation and Spelling.

This Cyclopædia uses the long-established convention of spelling Greek names which is also used by such modern scholars as Robert Graves and E. V Rieu

It is helpful to remember that :—

"ch" and "c" are pronounced "k"
"œ" and "æ" are pronounced "ē," as in "see"
"eus" rhymes with "juice."

Part II. NARRATIVE OUTLINES

THE OLYMPIAN CREATION MYTHS, 1–22.

1. Uranus and Ge. The infinite and empty space which existed before creation was known as Chaos The Earth, or Ge, sprang from Chaos, and herself gave birth to Uranus, the Heavens, and Pontus, the Sea Ge then became, by Uranus, the mother of the hundred-handed giants, the Hecatoncheires or Centimani (Cottus, Briareus, also called Ægæon, and Gyes or Gyges), of the one-eyed Cyclopes (Brontes, Steropes and Arges); and of the twelve Titans Greek writers give inconsistent lists of these Titans, but those most frequently mentioned are Cronus, Oceanus, Hyperion, and Iapetus, and the Titanesses Rhea, Themis, Tethys, and Mnemosyne.

2. Barbarous stories follow of Uranus' dealings with his descendants, and these have been influenced by myths from the Hittite culture which flourished in 1300 B.C in Anatolia, or Asia Minor, and which probably embodied still earlier Babylonian material These Hittite legends reached Greece through the Phoenicians, and Hesiod (eighth century B.C), a poet whose family had recently come from Asia Minor incorporated them in his *Theogony*.

3. Revolt of Cronus. Uranus had thrown his rebellious sons the Cyclopes into Tartarus, in the Underworld, and Ge persuaded the Titans, with the exception of Oceanus, to rise against their father. She gave Cronus, the youngest, a flint sickle, and with this he unmanned Uranus. Drops from the wound falling upon Mother Earth, she bore the three Erinnyes or Eumenides, the furies Alecto, Tisiphone, and Megaera, and from drops that fell into the sea Aphrodite was born

4. Uranus deposed, the Titans freed the Cyclopes, but Cronus, now supreme, consigned them again to Tartarus along with the Hundred-handed giants.

5. Cronus then married his sister Rhea, and mindful of the curse of Uranus and Ge, that he also would be deposed by his own son, he swallowed each of his children at birth.

6. Birth of Zeus. But when Zeus the youngest was born, Rhea gave Cronus a stone to swallow and saved Zeus, who, according to Minoan tradition, was brought up in the Dictæan cave in Crete In 1900 the reputed "birth-cave" was explored by archæologists—probably the first men to enter for two thousand years, and there they found votive offerings to the god which may have been left there in the second millennium B.C It was here that the Curetes, Rhea's priests, clashed their weapons to drown the cries of infant Zeus, while a goat, Amalthea, acted as his nurse, and was rewarded by being placed among the stars as Capricorn, while one of her horns became the Cornucopia or horn of plenty.

7. Zeus when of age was counselled by Metis, the daughter of Oceanus, and with Rhea's help gave to Cronus a potion which obliged him to disgorge first the stone and then his other children, Hestia, Demeter, Hera, Hades, and Poseidon. These now joined with Zeus in a contest against their father and the other Titans, who were led by Atlas

8. War between Zeus and Titans. The war, known as the Titanomachia, was waged in Thessaly, and lasted ten years, until Ge promised Zeus victory if he would free the Cyclopes and the Hundred-handed giants from Tartarus

9. The Cyclopes gave to Zeus a thunderbolt, to Hades a helmet of darkness, and to Poseidon a trident. Thus aided, the three brothers overcame Cronus, and the Hundred-handed giants stoned the other Titans, who were defeated and consigned either to an island in the West or to Tartarus, guarded by the Hundred-handed. Atlas was punished by being made to carry the sky on his shoulders, but the Titanesses were spared The supersession of the old dynasty of Titans by the new order of gods is the theme of Keats' fine poem, *Hyperion*.

10. The Olympians. Zeus and his brothers now divided the government by lot. To Hades fell the Underworld, to Poseidon the sea, and to Zeus the sky, while the earth was common to all. Zeus, the greatest of the gods, lived on the lofty summit of Mt Olympus between Macedonia and Thessaly, along with Poseidon and their sisters, Hestia, goddess of the hearth-fire, Demeter, goddess of agriculture, and Hera, who became the wife of Zeus Seven other divinities, Aphrodite, Pallas Athene, Apollo, Artemis, Hephæstus, Ares, and Hermes were also numbered among the twelve great Olympians, and at a later date a new-comer, Dionysus, took the place of Hestia.

11. The Giants' Revolt. But the troubles of Zeus were not over A post-Homeric story tells of the giants' revolt. Twenty-four giants with serpents' tails, sons of Ge, tried to avenge the imprisonment of their brothers the Titans by attacking Olympus. Led by Alcyoneus, they included Porphyrion, Ephialtes, Mimas, Pallas, Enceladus, and Polybutes. Only after terrible struggles in Olympus and on earth, were the giants defeated by the gods, who were helped by a magic herb of invulnerability found by Heracles, who always dealt the giants the final blow.

12. The story offered some explanation of huge bones found at Trapezus and volcanic fires at neighbouring Bathos and Cumæ, the reputed sites of the battles. The burial of Enceladus under Mt. Etna in Sicily, and of Polybutes under Nisyrus, likewise accounted for their volcanic nature The inclusion of Heracles before his apotheosis indicates the late origin of the legend.

13. Ephialtes and Otus. Another version of the giants' revolt ascribes it to the gigantic Alœidæ, Ephialtes, and Otus, sons of Iphimedeia by Poseidon, but named after Alœus, whom their mother later married. At the age of nine Ephialtes and Otus first captured and imprisoned Ares, god of war, and then, vowing to outrage Hera and Artemis, they piled Mount Pelion on

Ossa in their attack on Heaven. Artemis induced them to go to the island of Naxos in the hope of meeting her, but disguised as a doe she leapt between them and they killed each other in error. Hermes then released Ares, and the spirits of the Alcidæ were tied with vipers back to back to a pillar in Tartarus.

14. Typhon. After the destruction of the giants, Ge in revenge brought forth the gigantic monster Typhon, fathered on her by her own son Tartarus. His huge limbs ended in serpents' heads and his eyes breathed fire. When he approached Olympus the gods in terror fled to Egypt disguised as animals, Zeus as a ram, Apollo a crow, Dionysus a goat, Hera a white cow, Artemis a cat, Aphrodite a fish, Ares a boar and Hermes an ibis Athene alone was undaunted and persuaded Zeus to attack Typhon. After a fearful struggle, in which Zeus was temporarily incapacitated and only rescued by Hermes and Pan, he destroyed Typhon with his thunderbolts and buried him under Mt. Ætna, which still breathes fire.

15. The flight of the gods to Egypt serves to explain the Egyptian worship of them in animal form.

16. Prometheus and Epimetheus. The creation of mankind is often ascribed to Prometheus, whose name signifies "forethought," as that of his brother, Epimetheus, means "afterthought" These two, unlike their brother Atlas, had supported Zeus during the war with the Titans. But Prometheus, the clever benefactor of mankind, by stealing fire from Olympus and giving it to humans, brought upon himself divine vengeance.

17. The infuriated Zeus ordered Hephæstus to make a lovely woman, Pandora, the Eve of Greek myth, who was endowed by the gods with baleful powers and taken by Hermes to Epimetheus. When he had married her, she opened a box from which escaped all ills which plague mankind.

18. Zeus punished Prometheus by chaining him to a crag in the Caucasus, where all day long an eagle tore at his liver, which grew whole again during the night Only after many generations did Heracles, with the consent of Zeus, shoot the eagle and free the heroic rebel.

19. The agony of Prometheus is the theme of Æschylus' tragedy *Prometheus Bound*, the liberator is depicted in his lost drama, *Prometheus Unbound* Shelley's dramatic poem of the same name takes Prometheus as a symbol of those who challenge tyranny for the sake of mankind.

20. Deucalion and Pyrrha. Deucalion, the son of Prometheus, is the Noah of Greek myth. When Zeus decided to wipe out mankind by releasing a great flood on earth, Deucalion, warned by his father, made an ark which saved both himself and his wife Pyrrha, daughter of Epimetheus After nine days the flood subsided and the ark came to rest on Mt Parnassus

21. Deucalion and Pyrrha then earnestly prayed at the shrine of Themis that the earth might be re-peopled. Themis appeared and commanded them to throw the bones of their mother behind them. They interpreted this as meaning the rocks of mother earth and those flung by Deucalion became men, those thrown by Pyrrha women.

22. Their son, Hellen, was the mythical ancestor of all the Hellenes.

THE OLYMPIAN DEITIES, 23–128.

ZEUS, 23–28.

23. Zeus, identified with Jupiter by the Romans, was the greatest of the Olympian divinities, omnipotent king of gods, father of men, and possibly master even of fate. Legends of his origin and supremacy are told in para. 6–20.

24. Zeus was the bright god of the sky, whom the invading Achæans introduced into Greece in about 1200 B C, together with his consort Dione. Her worship, however, did not penetrate south of Zeus' shrine at Dodona in Epirus, where the rustling of oak leaves was interpreted as the voice of the god, and Zeus found other wives. His Olympian consort was Hera, who was in origin the Great Goddess of the pre-Hellenic matriarchal society. This marriage symbolises the fusion of the Achæans with their predecessors.

25. He first married Metis, daughter of Oceanus and Tethys, but when she was pregnant with Athene he swallowed her and brought forth Athene from his head. His second wife was Themis, daughter of Uranus and Ge, a divinity representing order, and their children were the Horæ and the Mœræ, or Fates, though some say that the Fates were daughters of Erebus and Night, and that even Zeus was subject to them. To Zeus and Hera were born the deities Ares, Hebe, and Hephæstus, unless the latter was the parthenogenous son of Hera. Zeus was also the father of Persephone by his sister Demeter, of the Charities, or Graces, by Eurynome, and of the Muses by Mnemosyne.

26. By mortal women four Olympian deities were children of Zeus; Hermes the son of Maia, Apollo and Artemis the children of Leto, and Dionysus the son of Semele. Zeus loved many mortal women, and Hera was intensely jealous and revengeful towards them and their children.

27. Although Zeus' earliest oracle was at Dodona, he was said to dwell with his fellow divinities on the summit of Olympus in Thessaly, and was also worshipped at Olympia in Elis The Greeks dated their era from the first festival of the Olympiad in 776 B C.

28. Zeus alone used the thunderbolt and was called the thunderer. The oak, the eagle, and mountain summits were sacred to him, and his sacrifices were usually bulls, cows, and goats. His attributes were the sceptre thunderbolt, eagle, and a figure of Victory held in his hand The Dodonean Zeus sometimes wore a wreath of oak leaves, the Olympian Zeus one of olive.

HERA, 29–35.

29. Hera, identified by the Romans with Juno, was the Great Goddess of the pre-Hellenic matriarchal society, whom Zeus, supreme god of the Achæans, appropriately took to wife

30. She was said to be a daughter of Cronus and Rhea and reluctantly married her brother Zeus, who in the form of a cuckoo sought her out at Cnossos in Crete, or perhaps in Argos, and their wedding night was spent on Samos Ge gave Hera the tree with the golden apples later guarded by the Hesperides

31. Though Hera was treated with reverence by the gods, she was greatly inferior in power to Zeus and must obey him, her subordination reflecting the attitude of the Achæans towards women Only in her power to bestow the gift of prophecy was Hera equal to her husband.

32. She was often rebellious and jealous of Zeus' intrigues and persecuted his children by mortal women At one time, with Poseidon and Apollo, she led a conspiracy of all the Olympians save Hestia to put Zeus in chains. He was freed by Thetis and Briareus, and punished Hera by hanging her with wrists chained to the sky and an anvil on each ankle.

33. Hera bore Zeus Ares and Hebe and annually renewed her virginity by bathing in a spring near Argos. As properly speaking, the only married goddess among the Olympians, she was worshipped

as goddess of marriage and the birth of children, the Ilithyiæ being her daughters.

34. Hera was of majestic stature, and her attributes were a diadem, veil, sceptre, and peacock Samos and Argos were seats of her worship.

35. Because of the judgment of Paris she was relentlessly hostile to the Trojans.

HESTIA, 36–37.

36. Hestia, called Vesta by the Romans, and the eldest sister of Zeus, was a divinity brought to Greece by the invading Achæans Though Poseidon and Apollo both sought her love, she swore by Zeus always to remain a virgin.

37. She was goddess of the fire on the hearth, supremely important in those days because so difficult to rekindle, and was naturally thought of as goddess of home life Each town or city had its sacred hearth, which, like that of the home, was an asylum for suppliants The first part of all sacrifices offered to the gods was due to Hestia, the most peaceable and kindly of all the Olympians, but at a later date Dionysus took her place among the twelve Olympian gods.

ATHENE, 38–45.

38. Athene, whom the Romans identified with Minerva, was the embodiment of wisdom and power.

39. The Achæans brought with them a young warrior goddess, who bore the titles, Kore, Parthenos, Pallas, meaning girl, virgin, maiden, and she was in about 1700 B C. identified with an older pre-Hellenic " Palace Goddess," worshipped in Crete The " Palace Goddess " was one aspect of the Great Goddess, revered not for motherhood but for feminine intuition, and from pre-Hellenic times comes the name Athene

40. The complex Pallas Athene was thus not only the patroness of women's arts such as weaving, protectress of agriculture, inventor of plough, rake, and ox-yoke, but also a warrior, a wise tactician, appearing in armour and wearing on her ægis or shield the head of Medusa, during the Trojan War the great protagonist of the Greeks Legends of the birth of Pallas Athene reveal how the patriarchal Hellenes took over, and made their own a matriarchal divinity.

41. She was said to be a daughter of Zeus and Metis, but before her birth an oracle had foretold that she would be a girl, and that if Metis had another child it would be a son who would depose his father. Zeus therefore swallowed Metis, and later, suffered an agonising headache as he walked by Lake Triton Hermes realising the cause, persuaded Hephæstus, or, according to some, Prometheus, to cleave open Zeus' skull, from which Athene sprang completely armed

42. The centre of her cult was Attica and Athens, and legend said that when Athene and Poseidon contended for the possession of the city, the gods judged it should belong to Athene, who in planting the olive-tree had conferred the better gift.

43. Preferring to settle quarrels peaceably, Athene established here the court of the Areopagus, where if votes were equal, she herself gave a casting vote to free the accused, as in the trial of Orestes.

44. In 566 B C Pesistratus founded the great Panathenaic festival, celebrated every fourth year, and its magnificent procession was represented on the frieze of the Parthenon now in the British Museum, while the birth of Athene was represented in the gable at the east end of the Parthenon, and the contest with Poseidon at the west. Pesistratus also introduced a new coinage, with the head of Athene on one side, and the owl, her bird, upon the other.

45. Other pre-Hellenic acropolipses were sacred to Athene, and her worship flourished in Sparta, Corinth, Argos, and Thebes.

HEPHÆSTUS, 46–56.

46. Hephæstus, identified with Vulcan by the Romans, was the smith-god, a superb artist in metals.

47. He probably originated as a pre-Hellenic fire-god near the Mt Olympus of Lycia in Asia Minor, where gaseous vapour, seeping through the soil, ignited The Lycians emigrated to Lemnos, where they became known as Pelasgians, and again found fire issuing from the earth, and this fire became the symbol of their god Hephæstus.

48. The cult of Hephæstus spread to Athens, where his artistic genius was so venerated that in the frieze of the Parthenon where two pairs of gods are given positions of honour, Zeus appears with Hera, and Hephæstus with Athene.

49. In Homer's time Hephæstus was one of the twelve Olympians, his exalted position reflecting the importance of the smith in a Bronze Age society when weapons and tools had magical properties He is, like other smith-gods, represented as lame, possibly because the tribe deliberately lamed their smith to prevent his running away, possibly because work at the forge developed muscular arms but feeble legs

50. According to Homer, Hephæstus was the son of Zeus and Hera, though later tradition says that he was son of the goddess alone, just as his fire sprang mysteriously from the earth

51. Born lame and weak, Hephæstus was so much disliked by Hera that she threw him from Olympus, when he fell into the sea and was cared for by the sea-goddesses Thetis and Eurynome in a grotto under the sea.

52. After nine years Hera took him back to Olympus, where he had a fire smithy, but on one occasion he enraged Zeus by taking Hera's part, so that he was again flung from Olympus, this time by Zeus He was a day falling, and alighted in the evening on the island of Lemnos, as described in *Paradise Lost*, Book 1, lines 740–746 Later writers diverge from Homer in making this second fall the cause of Hephæstus' lameness.

53. He again returned to Olympus and acted as mediator between Zeus and Hera, though the gods laughed at him as he hobbled about.

54. His workshop in Olympus was in his own palace, and all the palaces of the gods were made by him He also made the magnificent armour of Achilles, as is described in the eighteenth book of the *Iliad*, the necklace of Harmonia and the bulls of Æëtes Later accounts place his workshop on the volcanic island of Sicily, where the Cyclopes served him.

55. In the *Iliad*, Hephæstus' wife was Charis, but in the *Odyssey* she was Aphrodite, who was unfaithful to him with Ares How Hephæstus caught the two together in an invisible net he had made, and exposed them to the ridicule of the gods, is told in a poem known as the " Lay of Demodocus," incorporated in the eighth book of the *Odyssey*.

56. Hephæstus' favourite spots on earth were Lemnos, and volcanic islands like Lipara, Hiera, Imbros, and Sicily. In Greek art he is represented as a vigorous man with a beard, carrying a hammer or similar instrument, and wearing an oval cap or chiton.

APHRODITE, 57–63.

57. Aphrodite, goddess of desire, identified by the Romans with Venus, was derived from the Great Goddess of pre-Hellenic times, her counter-

parts being the orgiastic Ishtar of Babylon and Astarte of Syria.

58. She was worshipped as a fertility goddess at Paphos in Cyprus, whence Phœnicians took her worship to Cythera, an island off Southern Peloponnesus. Probably as late as the eighth century B.C. her fertility cult was established on Acrocorinthus above Corinth. There was a similar sanctuary on Mt. Eryx in Western Sicily In these places the goddess was served by young girls, but in other Greek states her worship was more that of protectress of the city.

59. According to Hesiod, Aphrodite sprang from the seed of Uranus and rose naked from the sea, as in Botticelli's picture "The Birth of Venus." Rising near the island of Cythera, she passed to Paphos in Cyprus.

60. Homer makes Aphrodite the daughter of Zeus and Dione, and represents her as wife to Hephæstus. She was, however, unfaithful to him and in love with Ares The amusing situation when they were caught together is described in para. 55. Harmonia was one of their children.

61. Aphrodite also bore sons to Poseidon, and Priapus to Dionysus, and later stories tell that she bore Hermaphroditus to Hermes, and Eros to either Hermes, Ares, or Zeus.

62. Her love for the mortal Adonis is the theme of Shakespeare's *Venus and Adonis*, and one of the Homeric hymns tells of her passion for Anchises, cousin of Priam, to whom she bore Æneas, the hero of Virgil's *Epic*. Unfortunately Anchises, boasting of Aphrodite's love, was struck by Zeus with a thunderbolt.

63. Aphrodite possessed a magic girdle which made the wearer irresistibly lovely and desirable. Doves and sparrows were sacred to her. Her most beautiful statue was that of Praxitiles in the fourth century B C, a copy of which is preserved in the Vatican. The Venus de Milo may be seen in the Louvre.

ARES, 64–67.

64. Ares, god of war, who was identified by the Romans with Mars, was a divinity of Thracian origin, whose worship spread through Macedonia to Thebes, Athens, and cities of the Peloponnesus, especially Sparta. Ares was, however, not popular with the Greeks, who disliked purposeless war and despised the Thracians for enjoying it, and their attitude is reflected in the myths of Ares.

65. He was the son of Zeus and Hera, and as he delighted in battle for its own sake he was hated by the other gods, except Eris, Hades, and Aphrodite, who was in love with Ares and he with her. The two were once trapped together in a net which Hephæstus had engineered, as is described in para. 55.

66. Ares was not always successful in battle. The Alœidæ conquered him and left him imprisoned in a brazen vessel for thirteen months, until he was released by Hermes Athene twice vanquished him, and Heracles also defeated him and forced him to return to Olympus.

67. According to a late tradition, Ares once defended himself before the gods in a trial where he was accused of murdering Halirrhothius, son of Poseidon. Since he pleaded that he had saved his daughter, Alcippe, from being violated, Ares was acquitted, and the place of the trial became known as the Areopagus.

APOLLO, 68–80.

68. Apollo's worship probably derived from two sources, from the Dorians, who in about 1100 B.C. entered Greece and reached as far south as Crete, and from Ionians, living in the islands and mainland of Anatolia, or Asia Minor, who became acquainted with a Hittite divinity worshipped in Lycia, and hence called Lycius.

69. Apollo's Dorian shrine was at Delphi, near the Castalian spring on Mt. Parnassus, where he was called the Pythian, or Loxias, the Ambiguous. His Ionian shrine was at Delos, where he was called Lycius, and Phæbus, or Shining, and where he was more closely associated with his twin-sister, Artemis.

70. Legends said that Apollo and Artemis were the children of Zeus and Leto, but before their birth, jealous Hera caused Leto to wander from place to place till she gave birth to Artemis under a palm-tree at Ortygia, and to Apollo beside a palm in the isle of Delos.

71. This story is told in the Delian Homeric Hymn of 700 B C., while the Delphic Hymn tells how Apollo, soon after his birth, sought out the she-dragon Python, on Mt. Parnassus, and there killed her, taking over the Oracle of Earth at Delphi, where his priestess the Pythoness became the mouthpiece of his oracles, which were imparted in hexameter verse. Apollo was commanded by Zeus to visit the Vale of Tempe for purification, and to preside over the Pythian games held in Python's honour.

72. Hera, still implacable, sent the giant Tityus to violate Leto, as she came with Artemis to Delphi, though some say that it was Artemis who was attacked, but the giant was killed by the arrows of Apollo and Artemis.

73. Apollo was not always subservient to Zeus. He once, with Hera, Poseidon, and other Olympians, bound Zeus with chains and was punished by being sent with Poseidon as bondman to King Laomedan, where by playing the lyre and tending the flocks he helped Poseidon to build the walls of Troy. On another occasion, furious that Zeus had slain his son Asclepius, Apollo retaliated by killing the Cyclopes Zeus now sent him to serve King Admetus of Pheræ in Thessaly, and again he kept flocks. He also helped Admetus to win his bride Alcestis and even ensured that the king should be restored to life if one of his family would die in his stead.

74. Apollo loved many mortal women, including Cyrene, mother of Aristæus, Coronis, mother of Asclepius, the healer, and Aria, mother of Miletus. The nymph Dryope was also seduced by Apollo, but when he pursued the nymph Daphne she cried for help and was turned into a laurel, henceforth Apollo's tree; and the nymph Marpessa preferred his rival, Idas. Apollo loved Cassandra, daughter of Priam, and conferred on her the gift of prophecy, but, when she disappointed him, decreed that she should never be believed. Hyacinthus, a Spartan prince, in origin an earth deity, was beloved by Apollo, and when he was killed by the god's jealous rival, Zephyrus, the hyacinth flower sprang from his blood.

75. Apollo had varied characteristics He was destroyer, as his arrows indicated, and sudden deaths were ascribed to him. It was he who sent plagues among the Greeks besieging Troy. But he was also protector, warding off evil, as his fatherhood of Asclepius indicated. He protected flocks and cattle, as his service to Laomedan and Admetus showed, and later writers particularly stressed this aspect.

76. As god of prophecy, Apollo could communicate the gift to gods and mortals, and of all the centres of his worship Delphi was the most famous. The shrine had probably been established by pre-Hellenic people, worshipping Mother Earth, and had been seized by invading Hellenes who killed Python the oracular serpent, took over the oracles in the name of their own Apollo, and held funeral games in honour of Python to placate the original inhabitants. The shrine was supposed to contain the Omphalos, or navel stone of earth, and a chasm which occasionally gave out intoxicating vapours. Over this Apollo's priestess, Pythia, sat on a tripod, and uttered his oracle after chewing intoxicating laurel leaf. She was regarded as the mystical bride of the god.

77. As god of song and music Apollo appears in the *Iliad* delighting immortals. He was said to have received the lyre from Hermes, and its seven strings were connected with the seven Greek vowels. In music none surpassed Apollo, not even Pan, nor Marsyas, the satyr who had found Athene's discarded flute which played by itself. Defeated in a contest, Marsyas was flayed alive by the victorious god. Apollo was the leader of the Muses, or Musagetes. He valued order and moderation in all things, his favourite maxims being "Nothing in Excess," and "Know thyself."

78. Apollo also delighted in the foundation of towns, and his oracle was always consulted before a town was founded.

79. In later writers he was identified with the sun god, the result of Egyptian influence, for in Homer, Helios, god of the sun, is completely distinct from Apollo.

80. The worship of Apollo, typical of all that is most radiant in the Greek mind, has no counterpart in the religion of Rome. Not till the end of the third century B.C. did the Romans adopt his religion from the Greeks.

ARTEMIS, 81–89.

81. Artemis, whose Roman counterpart was Diana, had two chief aspects. One was as "Mistress of Animals," a goddess of the chase, worshipped in primitive matriarchal society, and probably owing something to the Britomartis and Dictynna, worshipped as huntresses in Crete. The other, originating in Asia Minor, was of the age-old mother-goddess, and is most clearly seen in Artemis Ephesia, who was worshipped as an orgiastic goddess.

82. Legends of the birth of Artemis are told in the story of Apollo, and as his sister she shared many of his characteristics. She carried bow and arrows, made for her by Hephaestus, and had power to send plague and sudden death, as when she and Apollo killed the children of Niobe. She was also protectress of children and young animals and goddess of the chase.

83. Like Apollo, Artemis was unmarried, and later writers stressed that she was a maiden goddess and severely punished any lapses. She changed Actaeon to a stag to be torn to pieces by his own hounds, only because he had seen her bathing, and some traditions say that she killed Orion because of his unchastity. The nymph Callisto, who had been seduced by Zeus, was in the form of a bear hunted down by the hounds of Artemis.

84. When Apollo was identified with the Sun, Artemis was identified with Selene, the Moon.

85. The Arcadian Artemis, early worshipped in Arcadia as a huntress among the nymphs, was unconnected with Apollo.

86. Another aspect of the goddess was as the fierce Artemis of Tauris, to whom all strangers were sacrificed. Iphigeneia was once her priestess, and she and Orestes took her image to Brauron in Attica, whence the goddess was called Brauronia. This Brauronian Artemis was worshipped in Athens, and also in Sparta, where boys were scourged at her altar until they sprinkled it with their blood.

87. Artemis as an orgiastic goddess had her chief centre in Ephesus, with its immensely wealthy temple, and it was this Artemis that St. Paul encountered. (See Acts of the Apostles, Ch. XIX.)

88. Though usually regarded as a rural divinity, Artemis was supreme in three great cities, in Ephesus, in Marseilles, to which Ionian Greeks from Asia Minor took her cult between 600 and 540 B.C., and in Syracuse, where she was known as Artemis Arethusa.

89. The goddess was often portrayed as a huntress, as in the so-called Diana of Versailles, now in the Louvre. As huntress her chlamys reached only to the knees, and she carried a bow, quiver, and arrows, or a spear, and was accompanied with stags or dogs. As Selene, she wore a long robe and veil, and a crescent moon on her forehead.

HERMES, 90–98.

90. Hermes, whom the Romans called Mercurius, was originally one of the gods of the pre-Hellenic people, the divinity dwelling in the cairn, or "herma," set up by shepherds as a landmark in wild country, and so developing as a protector against predatory animals and a guide to travellers. This Hermes was identified with a similar divinity worshipped in Minoan Crete, a "Master of Animals," a son or lover of the Great Goddess, and therefore a god of fertility.

91. Legends said that Hermes was the son of Zeus and Maia, an embodiment of the Great Goddess, and a daughter of Atlas, whence Hermes' name Atlantiades.

92. The "Hymn to Hermes" of 600 B.C. tells that he was born in a cavern on Mt. Cyllene in Arcadia (from which he was sometimes called Cyllenius), and that he grew with amazing rapidity. When only a few hours old he went to Pieria and stole some of the oxen of Apollo, which he drove to Pylos, and then, returning to Cyllene, he invented the lyre by stringing a tortoise-shell with cow-gut. Apollo, on discovering the thief, accused him to Zeus, who ordered Hermes to restore the oxen. But when Apollo heard the lyre he was delighted, took it in exchange for the oxen, and became the friend of Hermes, leading him back to Zeus.

93. Zeus gave to Hermes supreme power over animals and appointed him his herald. Hermes also acted as herald to Hades, conducting shades to the underworld. (See Virgil's *Æneid*, Bk. IV, ll. 242 *sqq.*) As herald he was regarded as god of eloquence, whence St. Paul, "the chief speaker," was mistaken for him in Lystra of Asia Minor. (See Acts of the Apostles, Ch. XIV.) Heralds promote peace and therefore trade. Thus Hermes came to be looked on as god of peaceable commerce.

94. He was also god of prudence and cunning, and even of theft, and was said to have helped the Fates in composing the alphabet. Many inventions ascribed to Hermes, such as weights and measures, the musical scale, astronomy, olive-culture, and the arts of boxing and gymnastics, were pre-Hellenic, and the stories of his childhood may indicate how the Hellenes took over these arts in the name of their god Apollo. As a god of fertility and luck, Hermes presided over games of dice.

95. He played a part in such incidents as the rescue of Dionysus, the punishment of Ixion, the selling of Heracles to Omphale, the judgment of Paris, and the leading of Priam to Achilles, but his most famous exploit was perhaps the slaying of Argus, the hundred-eyed giant sent by Hera to watch Io.

96. Hermes had several sons, including Echion, herald to the Argonauts, Autolycus the thief, his son by Chione, and Daphnis.

97. His worship flourished in Arcadia, where he was to be found with Pan and the muses. It spread to Athens, and he became one of the best loved of the Olympians.

98. Hermes' attributes were the Petasus, a travelling-hat, in later time adorned with wings, the Alipes, or winged-sandals, and the Caduceus, or heralds' staff, whose white ribbons were later mistaken for serpents because he was herald to Hades. Sacred to Hermes were the tortoise, the palm-tree, the number four, and some kinds of fish, and his sacrifices were incense, honey, cakes, pigs, lambs, and kids.

POSEIDON, 99–109.

99. Poseidon, identified by the Romans with Neptune, derived from a god worshipped by the earliest Aryan invaders of Greece, the Minyans and Ionians, who entered the country in about 2000 B.C. It was with the aid of horses and wheeled vehicles that they quickly overcame any resistance, and their god Poseidon was often thought of as the horse whose hooves thunder on the earth. He is constantly spoken of in Homer as "earth-shaker," while many legends show him in equine guise. It is possible that he was originally thought of as a sky-god, a thunderer, and the mate of an earth-goddess who later developed as Demeter.

100. But when in about 1450 B.C., another wave of invading Aryans, the Achæans, entered Greece, they also brought their sky-god, a thunderer called Zeus, possibly in origin identical with Poseidon, and the latter, recognised as an older brother of Zeus, came to be revered as a sea-divinity, for the Minyans were, by now, expert in navigation.

101. According to legend, Poseidon was the eldest son of Cronus and Rhea, and when, after the deposition of Cronus, he and his brothers Zeus and Hades cast lots for sovereignty, the sea became Poseidon's share. He dwelt in an under-water palace near Ægæ in Eubœa, which is described in the beginning of the 13th book of the *Iliad*, and here he kept his horses with brazen hooves and golden manes, and when they drew his chariot over the sea it became tranquil.

102. He was said to have created the horse when disputing with Athene for the possession of Athens, and he taught men how to bridle horses. He was the protector of horse-races, and horse and chariot races were held in his honour on the Corinthian isthmus.

103. In the form of a horse he raped his sister Demeter, when she was disguised as a mare. Their offspring were the horse Arion and the nymph Despœna, and some say Persephone also, though according to another version Demeter was searching for Persephone, her daughter by Zeus, at the time of the rape.

104. Poseidon, though equal to Zeus in dignity, was less powerful and resented the pride of his younger brother. He once joined with Hera, Apollo, and other Olympians, to put Zeus in chains, and he and Apollo were punished by being sent as bondsmen to Laomedan. Here Poseidon built the walls of Troy, hence called Neptunia Pergama. When Laomedan refused the wages due, Poseidon sent a sea-monster, which would have devoured the king's daughter Hesione if she had not been rescued by Heracles. In the Trojan War, Poseidon naturally sided with the Greeks, though he became hostile to Odysseus after he had blinded Polyphemus, son of the god.

105. Poseidon desired earthly kingdoms, his attempts to take control possibly being political myths. He disputed with Athene for the possession of Athens, but she was awarded the city because her planting of the olive was judged the better gift. When these divinities, however, disputed the possession of Troezen, Zeus judged they should share it equally. In his claim for Corinth, Poseidon received only the isthmus, where the quadrennial Isthmian games were held in his honour, while the Areopagus was awarded to Helios.

106. Poseidon first intended to marry Thetis, but when it was prophesied that her son would be greater than his father he paid court to Amphitrite, daughter of Nereus. Only after Delphinos had most eloquently pleaded his suit did Amphitrite accept Poseidon, who in gratitude placed Delphinos' image among the stars, as the Dolphin. Amphitrites' reluctance, paralleled by Hera's shrinking from Zeus, and Persephone's from Hades, probably represents the resistance of an early matriarchal society to a patriarchal system.

107. Poseidon's son by Amphitrite was Triton, but he had many more children by other divinities and mortals.

108. One of them, Scylla, was particularly hateful to Amphitrite, who is said to have turned her into a monster with six barking heads and twelve feet. Poseidon also loved the nymph Tyro, mother of his children Pelias and Neleus, and Æthra, the mother of Theseus. His offspring by Medusa were Chrysaor and Pegasus.

109. Sacrifices to Poseidon were usually black-and-white bulls. His symbol of power was the trident, possibly in origin a thunderbolt, by means of which he could shake the earth or subdue the waves, and which became in Hellenistic and Roman times a symbol of sea-power, as it is today. Poseidon's other attributes were the horse and the dolphin, and he was usually represented as accompanied by Amphitrite, Triton, Nereids, and dolphins.

DEMETER, 110–116.

110. Demeter, counterpart of the Roman Ceres, was probably in origin a divinity of the Minyans, who entered Greece in about 200 B.C., and who revered her as an earth-goddess, a mate to their sky-god, who later developed as Poseidon. Both these divinities could take the form of a horse. The worship of this earth-goddess then merged with that of the Great Goddess of the pre-Hellenic matriarchal society, and Demeter was worshipped as the corn-goddess.

111. She was daughter to Cronus and Rhea, and sister to Zeus, by whom she became the mother of Persephone, or Core, the maiden, herself another aspect of the goddess. According to the Homeric Hymn of the seventh century B.C., Hades asked Zeus' permission to marry Persephone, and as he received no downright refusal was emboldened to carry off the maiden as she was gathering flowers. Demeter wandered the earth searching for her daughter until Helios told her what Hades had done. She then shunned Olympus and wandered still on earth, which she forbad to bring forth fruit. Zeus finally told Demeter that her daughter might return, provided she had eaten nothing in the Underworld, and he sent Hermes to escort her back. Hades agreed to let Persephone go, but gave her a pomegranate to eat, and it was at last agreed that she should spend a third of the year with him in Hades, as Queen of the Underworld, and the rest of the year with Demeter, who once more allowed the earth to bear its fruit.

112. Inconsistent accounts are given of the place of the rape. Demeter's priests said it was Eleusis, about twelve miles from Athens, the Latin poets Enna in Sicily, where, according to Ovid, Persephone was gathering poppies. Some say it was Ascalaphus who saw Persephone take food in the Underworld and that because he revealed this, he was turned by Demeter into an owl.

113. It is said that during her wanderings, Demeter punished those, like Abas, son of Celeus, who were unkind to her, but showered blessings on those like Celeus himself and his son Triptolemus who received her hospitably in Eleusis and whom she taught the art of agriculture.

114. The Eleusinian Festival in honour of Demeter and Persephone was probably fully established in Athens by Peisistratus at the end of the sixth century B.C., probably about the time when the cult of Dionysus was instituted. There was an annual procession from Eleusis to Athens, and those who spoke Greek could be initiated into the final rite of the mysteries. The Thesmophoria, celebrating the foundation of laws, was also held in the goddesses' honour, in Athens and in other parts of Greece.

115. The myth originated in the most primitive rites of seed time and harvest at a time when only women practised the arts of agriculture. Persephone, representing the vegetation which dies down during the winter, had her counterpart in the primitive corn-puppet which was buried in winter to be dug up again sprouting in spring, and later writers saw the story as an expression of the death of the body and the immortality of the soul.

116. In art Demeter was represented with a garland of corn or a ribbon, and holding a sceptre, corn ears, or a poppy, and sometimes a torch and basket. Pigs were sacred to her There is in the British Museum a fine statue of Demeter of about 330 B C, which was found at Cnidos in Asia Minor.

DIONYSUS, 117-128.

117. Dionysus, god of wine, also called Bacchus by both Greeks and Romans, was not in Homer's time one of the aristocratic Olympian deities, but a god worshipped by humble folk whom wandering bands of ecstatic worshippers brought into Greece from Thrace in the eighth century B C The cult, which spread through Macedonia and Thessaly, to Bœotia, Delphi, Athens, and beyond, was characterised by a mystic frenzy when the worshippers, intoxicated with wine, believed themselves to be at one with Dionysus or Bacchus, sometimes called Bromius "the Boisterous" The men who followed him were known as Bacchoi, the women Bacchæ, or Bacchantes or Mænads, or in Athens and Delphi, Thyiads

118 The immense popularity of the Dionysian cult, especially with women, indicates that among the recently civilised Greeks there was a longing for a more instinctive and impulsive life, valuing enthusiasm rather than prudence, and during the sixth century certain wise statesmen introduced the new cult among the other state religions Dyonisiac festivals were established in Corinth, Sicyon, Delphi, and Athens In Delphi the sepulchre of Bacchus was placed near the very tripod of Pythia, and his temple, a theatre, was at the highest point of the sacred precinct In Athens Peisistratus founded the Dionysia and the Panathenaic Games at about the same time, and a theatre was set up where the worshippers of Bacchus enacted the first primitive drama In the fifth century, when the Parthenon was finished, the new god had been accepted among the twelve Olympians taking the place of Hestia This change incidentally secured a majority of gods over goddesses on Mt Olympus, and is perhaps evidence of a society becoming increasingly patriarchal.

119. Legends said that Dionysus was the son of Semele by Zeus, who visited his beloved disguised as a mortal When Semele was six months with child, jealous Hera, disguised as an old woman, persuaded her to ask her mysterious lover to appear in his true form Unwillingly Zeus consented, "hapless Semele" was consumed by fire, and her unborn child sewn up in Zeus' thigh to be delivered three months later as Dionysus

120. The child was first entrusted to Athamas and Ino of Bœotia, and reared in the women's quarters disguised as a girl, until Hera undeceived punished Athamas with madness so that he killed his own son. Hermes then took Dionysus to Mt. Nysa, where the nymphs cared for him, feeding him with honey, and where he first invented wine. Zeus later placed the images of the nymphs among the stars as Hyades.

121. When Dionysus had grown to manhood Hera drove him mad and he wandered through the world with his old tutor Silenus and a wild rout of Satyrs and Mænads. He went through Egypt, Syria, and Asia to India, overcoming military opposition, teaching the culture of the vine, founding cities and laws He returned to Europe through Phrygia and then invaded Thrace.

122. Here Lycurgus, King of the Edones, opposed his worship, but, maddened by Rhea, he killed and mutilated his own son, and the Edones caused him to be torn to death by horses.

123. Dionysus now proceeded to Bœotia, and in Thebes was resisted by King Pentheus. But Pentheus was also driven mad and torn to pieces by the Mænads or Bacchæ, among whom were his own mother Agave and her two sisters, for in their frenzy they believed him to be a wild beast. This is the legend used by Euripides in his play, *The Bacchæ.*

124. Dionysus also visited the islands of the Adriatic. At Icaria he hired a ship bound for Naxos, but the sailors were Tyrrhenian pirates and steered towards Asia, intending to sell Dionysus into slavery. The god, however, turned himself into a lion and the oars into serpents Ivy grew round the ship and flutes were heard. The terrified pirates, leaping overboard, were transformed to dolphins. Arrived at Naxos, Dionysus found Ariadne deserted by Theseus and at once married her A Renaissance conception of this incident can be seen in Titian's picture "Bacchus and Ariadne" in the National Gallery, or in Tintoretto's picture in the Doge's Palace in Venice.

125. At Argos people refused at first to accept Dionysus, but when the women had been maddened by him, they admitted he was a god.

126. His worship established throughout the world, Dionysus was received into Olympus as one of the twelve great divinities, taking the place of Hestia He brought Semele there from the Underworld, and she was henceforth known as Thyone.

127. Dionysus was worshipped as god of the vital and intoxicating powers of nature, and also, because of his close connection with tillage and early civilisation, as a law-giver He was also god of tragic art In art he was represented as young, handsome, and athletic, but later as slightly effeminate He was accompanied with a wild crowd of Satyrs, and Mænads, the latter frenzied with wine and mystic exaltation, and carrying cymbals, swords, serpents, or the Thyrsus, a wand wreathed with ivy and crowned with a fir-cone. The worship of Dionysus appealed strongly to women, and many would spend the whole night on the mountain in ecstatic dancing and tearing wild animals to pieces Sacred to the god were the ivy, laurel, and asphodel, and the dolphin, serpent, tiger, lynx, panther, and ass. His sacrifice was usually a goat or ass

128. The myths of Dionysus are evidence that there was at first much opposition to the ritual use of wine, and the frenzy it engendered. The earlier drink of the Greeks had been a kind of beer flavoured with ivy and mead, and mead was the drink of Homer's Olympians Wine was not invented by the Greeks, but probably first imported by them from Crete, whither vine culture had probably spread from Mt. Nysa in Libya. The use of wine spread from Thrace to Athens and other civilised cities The story of Dionysus' wanderings in India represents the spread of vine culture there.

PERSEUS, 129-144.

129. The ancient folk-tale of Perseus, grandson of Acrisius, has been told by Kingsley in *The Heroes.*

130. Acrisius and Prœtus, the twin sons of Abas, King of Argos, eventually agreed, after much discussion, to divide their inheritance. Proetus became ruler of Tiryns, whose massive walls he built by the aid of the Cyclopes, while Acrisius ruled uneasily in Argos, for an oracle had declared that he would be killed by a son born to his daughter Danaë.

131. To prevent this disaster, Acrisius had Danaë immured in a brazen dungeon or tower, with doors of brass, but all in vain, for Zeus visited her in a shower of gold, and she became the mother of Perseus.

132. Not daring to kill Danaë, Acrisius set mother and son adrift on the sea in a chest, which floated to the isle of Seriphos, one of the Cyclades. Here it was found by the sailor Dictys, and he took Danaë and her son to the king Polydectes, who received them hospitably.

133. When Perseus was grown to manhood. however, Polydectes sought to marry Danaë and

seized a pretext to send Perseus off to fetch the head of the Gorgon Medusa.

134. Medusa and her sister Gorgons, Stheno and Euryale, who were the daughters of Phorcys and Ceto, and dwelt in Libya, had once been beautiful. But Medusa lay with Poseidon in one of the temples of Athene, and the enraged goddess turned her into a winged monster with brazen claws and serpent hair, so hideous that she turned to stone all who looked upon her.

135. Athene, eager to help Perseus, against her enemy, gave him a polished shield whereby he might see Medusa only in reflection. Hermes provided him with a sickle, and told him how to procure winged sandals, a magic wallet in which to carry the decapitated head, and Hades' helmet of invisibility.

136. On Hermes' advice Perseus visited the Gorgons' sisters, the Grææ, three old women grey from birth who had only one eye and one tooth between them, and these they passed from one to another. Perseus found them on Mt Atlas, and, by snatching the eye and tooth, forced the Grææ to tell him where he could find the sandals, wallet, and helmet. They directed him to the Stygian nymphs, who gave him what he needed.

137. Flying westward to the land of the Hyperboreans, Perseus found the Gorgons asleep. He successfully beheaded Medusa and was astonished to see, springing fully grown from her body, the winged horse Pegasus and the warrior Chrysaor, both of whom had been begotten on her by Poseidon.

138. Though pursued by Stheno and Euryale, Perseus in Hades' helmet escaped to the south. Some say that he petrified the Titan Atlas by showing him the Gorgon's head and then flew over Æthiopia.

139. Here he saw, chained naked to a rock on the sea coast, the lovely Andromeda, and at once fell in love with her. He learned the cause of her plight from her parents, Cepheus, King of Æthiopia, and his wife Cassiopeia. The latter had rashly boasted that Andromeda was more beautiful than the Nereids, and when they had complained of this to Poseidon, the sea god had sent a monster to lay waste the country. Only by the sacrifice of Andromeda, said the oracle of Ammon, could the land be delivered.

140. Perseus promptly offered to rescue the maiden, provided she would become his wife, but, after he had slain the monster, Cepheus and Cassiopeia were reluctant to keep their promise, for they said Andromeda had already been contracted to another. Their protegé and his followers, arriving at the wedding, attempted to seize the bride, but were easily circumvented by Perseus, who showed them Medusa's head and turned them all to stone. Poseidon set the images of Cepheus and Cassiopeia among the stars, the latter in a humiliating position.

141. Perseus, with Andromeda, now hastened to Seriphos, where he found that Danaë and Dictys had been obliged to take refuge in a temple, but going to Polydectes' palace, he exposed the Gorgon's head and turned the king and all his followers to stone. He then gave the head to Athene, who set it in her ægis, and Hermes restored Perseus' accoutrements to the Stygian nymphs.

142. After making Dictys King of Seriphos, Perseus, taking with him Danaë and Andromeda, returned to Argos, and Acrisius, mindful of the oracle, fled to Larissa, in vain, however, for Perseus, visiting Larissa and taking part in public games, accidentally killed his grandfather by a throw of the discus.

143. Grieved by this mishap, Perseus arranged to exchange kingdoms with his cousin Megapenthes, the son of Prœtus, who now moved to Argos while Perseus became King of Tiryns. He also founded Mycenæ, which, like Tiryns itself had mighty fortifications built by the Cyclopes.

144. The massive remains of both cities have been investigated by Schliemann and other archæologists, and remain as some of the most interesting antiquities in all Greece.

BELLEROPHON, 145-150.

145. The story of Bellerophon is told by William Morris in *The Earthly Paradise.*

146. Bellerophon, the son of Glaucus, King of Corinth, having killed one Bellerus, fled to Prœtus, King of Tiryns. Unfortunately Prœtus' wife, Anteia, fell in love with the young man, and when he refused her advances falsely accused him to her husband of trying to seduce her. Prœtus, reluctant to kill a guest, sent him instead to Anteia's father, Iobates, King of Lycia, carrying a letter which requested that the bearer be put to death.

147. Iobates also shrank from killing a guest and decided to send Bellerophon against the Chimæra, a fire-breathing monster with a lion's head, goat's body, and serpent's tail, said to be the offspring of Echidne and Typhon, which was now ravaging Lycia.

148. Bellerophon was advised to catch the winged horse Pegasus, sprung from Medusa. Pegasus, by striking his hoof on the earth of Mt. Helicon, had created the spring of Hippocrene, sacred to the Muses, and he was found by Bellerophon at another of his fountains, that of Pirene in the Acropolis of Corinth. The hero flung over the horse's head a golden bridle, which Athene had given him, and astride his flying steed he easily shot the Chimæra with his arrows.

149. The frustrated Iobates now sent Bellerophon against the Amazons, and, when the hero again returned victorious, planted an ambush of guards against his arrival. Bellerophon slew them all, and Iobates, convinced at last that there had been some mistake, produced Prœtus' letter and learned the truth. He gave his guest his daughter in marriage and made him his heir.

150. Later tradition records that Bellerophon presumptuously tried to soar to Olympus mounted on Pegasus, but that Zeus sent a gadfly which stung the horse and caused him to throw his rider to earth. Bellerophon ended his days in wretchedness, but Pegasus gained Olympus.

JASON AND THE ARGONAUTS, 151–163.

151. The story of Jason and the Argonauts was already popular in Homer's day, and has more recently been told by Kingsley in *The Heroes*, and by William Morris in *The Life and Death of Jason*

152. Jason's father Æson, the rightful King of Iolcus, had been deprived of his kingdom by his two half-brothers, Pelias and Neleus. The mother of all three was Tyro, who, seduced by Poseidon, bore him the twins Pelias and Neleus. She exposed the twins, but they were reared by a horse-herd, and when Tyro later married Cretheus, founder and King of Iolcus, they were adopted by him.

153. Tyro's son by Cretheus was Æson, but on Cretheus' death Pelias imprisoned Æson, expelled Neleus, and made himself supreme. The life of Æson's infant son Jason was saved only because he was smuggled out of Iolcus and entrusted to the care of Cheiron, the Centaur.

154. When a young man, Jason returned to Iolcus, fearlessly demanding his kingdom, and

Pelias, to be rid of him, asked him to go to Colchis to fetch the golden fleece. This, the fleece of the ram on which Phrixus had escaped, and which he had given to King Æëtes of Colchis, was now hanging on an oak-tree in the grove of Ares, guarded night and day by a sleepless dragon.

155. Jason welcomed the enterprise and commanded Argus, the Thespian to build him a fifty-oared ship called the *Argo*, into whose prow Athene herself fitted an oracular beam. Most of the heroes of the day flocked to join Jason, and his crew included the Dioscuri, Castor and Polydeuces, Heracles, and Orpheus the musician.

156. They met many adventures on the way After lingering too long with the women of Lemnos, they slipped through the Hellespont and reached Mysia. Here Hylas, the squire of Heracles, while fetching water was stolen away by the Naiads, leaving nothing but an empty pitcher, and Heracles left the *Argo* in a vain search for him.

157. On the island of Bebrycos the Argonauts were met by its king, Amycus, son of Poseidon, and a renowned boxer, who contrived to kill all strangers by challenging them to a boxing match, but Polydeuces met the challenge and killed the bully In Thrace they freed the blind king and prophet Phineus from a plague of Harpies, and in gratitude he advised Jason how to navigate the Bosphorus At its entrance were the perilous floating islands, the Symplegades. It is possible that rumours of icebergs gave rise to the fable of these islands, which clashed together and crushed any ship which attempted to pass between them. But Jason, following the advice of Phineus, released a dove, and the *Argo* slipped between the islands as they recoiled. Henceforth they remained fixed. After overcoming other dangers, the Argonauts at last reached the River Phasis and Colchis.

158. Here Æëtes promised that he would give Jason the fleece if he could yoke together two fire-breathing bulls with brazen feet, the work of Hephæstus, plough the field of Ares, and sow it with the dragon's teeth left over by Cadmus at Thebes It was Medea who enabled Jason to perform this terrible task. This sorceress princess, the daughter of Æëtes by his first wife, fell instantly in love with Jason and promised to help him if he would swear by all the gods to marry her and be faithful She gave him a fire-resisting lotion and he completed the task. Then when Æëtes failed to keep his promise Medea charmed the dragon to sleep while Jason took down the fleece and they fled together in the *Argo*.

159. The furious Æëtes pursued them, but Medea ruthlessly murdered the young half-brother Absyrtus she had brought with her, and cut him into pieces which she dropped one by one over the side of the boat, Æëtes, stopping to collect the fragments for burial, soon lost sight of the fugitives.

160. There are many conflicting accounts of the *Argo*'s return journey, but none of them is feasible, for the Greek knowledge of geography was at that time very limited. Tradition said that the ship reached the Western Mediterranean and visited the island of Circe, who purified Jason and Medea of murder.

161. On their return to Iolcus they found that Pelias had forced Æson to take his life, though one tradition mentioned by Ovid and by Shakespeare in *The Merchant of Venice*, says that he was renewed to youthful vigour by Medea All agree that Medea took a terrible revenge on Pelias She persuaded his daughters, with the exception of Alcestis, to cut their father up and boil him in a cauldron, promising falsely that this would rejuvenate him. Pelias' son Acastus, horrified at the murder, then expelled Jason and Medea and they repaired to Corinth.

162. For many years they lived happily until they were involved in the final tragedy, dramatised by Euripides in his *Medea*. Jason deserted Medea for Glauce, also called Creusa, daughter of Creon, and the sorceress sent the young bride a garment which consumed her in flames, set fire to the palace, and involved Creon also in death. Some say that Medea also killed her own children by Jason.

163. Medea then escaped in a chariot drawn by winged serpents and took refuge with Ægeus of Athens, who married her. But on Theseus' arrival in the city, Medea departed and after many wanderings became an immortal Some say that Jason took his own life, others that he was mercifully killed when the poop of his own ship *Argo* fell upon him.

HERACLES, 164-202.

164. Heracles, the most famous of the Greek heroes, was the son of Alcmene by Zeus.

165. Alcmene's brothers having been killed by the Taphians, she would not consummate her marriage with her husband Amphitrion, son of Alcæus, until he had avenged their death. While Amphitrion was away from Thebes fighting the Taphians, Zeus visited Alcmene in her husband's likeness and told her how he had been victorious. The true Amphitrion returned the following day, and the ensuing confusion is the theme of comedies by Plautus, Molière, and Dryden.

166. Nine months later Zeus boasted that he was about to become the father of a son who would be called Heracles, or glory of Hera, and who would be ruler of the house of Perseus. The jealous Hera exacted from him a promise that any son born that day to the house of Perseus should be king She then hastened the birth of Eurystheus, who was a grandson of Perseus, and delayed that of Heracles Alcmene bore two children, Heracles, son of Zeus, and Iphicles, Amphitrion's son, who was a night younger Alcmene, fearing Hera, exposed Heracles, but Hera in error nursed him, thus conferring on him immortality

167. Returned to Alcmene, Heracles prospered, and when still in his cradle, strangled with either hand two terrible snakes which Hera had sent to destroy him In his youth he was taught how to drive the chariot by Amphitrion, fighting by Castor, how to sing and play the lyre by Eumolpus, wrestling by Autolycus, and archery by Eurytus. Linus, who was once teaching him to play the lyre, censured him, and Heracles then promptly killed his teacher with his own lyre, so Amphitrion sent him away to keep cattle.

168. In his eighteenth year he set out to attack the lion of Mt Cithæron which was destroying the herds of both Amphitrion and his neighbour Thespius. The chase lasted fifty days, and Thespius, who was Heracles' host all this time, rewarded him by giving up his fifty daughters to him. Heracles killed the lion with a wild-olive club and made himself a garment of the pelt, with the head as helmet, though some say that he wore the skin of the Nemean lion.

169. On his return to Thebes, Heracles challenged the Minyan heralds from Orchomenus, who had come to collect tribute of cattle, and then led a victorious campaign against the Minyans in which his foster-father Amphitrion was killed.

170. Heracles was rewarded by Creon King of Thebes, who gave him his eldest daughter, Megara or Megera, in marriage, and Heracles became by her the father of several children. Creon's youngest daughter was married to Iphicles.

171. But Hera now visited Heracles with madness, so that he killed his own children and two of Iphicles'. When he recovered his reason he went, after purification, to consult the oracle at Delphi. The Pythia, calling him, for the first time, Heracles, advised him to go to Tiryns and there serve Eurystheus King of Argos for twelve years, doing whatever he was commanded. At the end of that time immortality would be conferred on him.

172. Most reluctantly Heracles set out. The gods gave him gifts of armour, but he relied on his bow and arrows and on the olive clubs which he cut for himself. His nephew Iolaus, oldest son of Iphicles, accompanied him as his faithful charioteer and companion. Thus supported, Heracles embarked on the twelve gigantic tasks imposed on him by Eurystheus.

THE TWELVE LABOURS OF HERACLES.

173. **The First Labour** was to bring back the skin of the Nemean or Cleonæan lion, an enormous creature, said to be the offspring of Typhon and Echidne, which was devastating the valley of Nemea near Cleonæ. As the pelt could not be pierced by any weapon, Heracles strangled the lion with his hands. He rededicated the Nemean games to Zeus and took the lion's carcase back to Tiryns, where he flayed it with its own claws. Some say that he wore the pelt as his armour. Eurystheus was so terrified that he now took refuge in a brazen urn below the earth whenever Heracles approached.

174. **The Second Labour** was to kill the Lernean Hydra, another monster which was said to be the offspring of Echidne by Typhon, and which Hera brought up. It lived at the sevenfold source of the River Amymone and haunted the neighbouring swamp of Lerna. It had a dog-like body and nine snaky heads, one of them immortal. As soon as Heracles struck off one head with his club, two grew in its place, while an enormous crab seized the hero's foot He crushed the crab and called on Iolaus to burn the necks of the eight heads as he crushed them. The immortal head was buried and Heracles poisoned his arrows in the monster's gall, so that henceforth any wound they caused was fatal. Hera placed the image of the crab among the signs of the zodiac.

175. **The Third Labour** was to capture alive the Cerynelan Hind This creature had brazen feet and golden antlers, and was therefore often called a stag. Heracles pursued it tirelessly for a year, and eventually shot an arrow which pinned the forelegs together without causing bloodshed. He then carried the creature back on his shoulders.

176. **The Fourth Labour** was to capture alive the Erymanthian boar, which had come down from Mt. Erymanthus to ravage Psophis. During his journey Heracles was entertained by the Centaur Pholus, who had a cask of wine given by Dionysus When this was opened, other Centaurs besieged the cave. Repulsed by Heracles, some of them fled to the Centaur Cheiron. Heracles accidentally wounded Cheiron, who was an old friend, with one of his poisoned arrows Cheiron, an immortal, could not die, although he now longed to do so, and was relieved from pain only when he later surrendered his immortality to Prometheus. Heracles continued his pursuit of the boar, drove it into a snow-drift, bound it with chains and carried it to Eurystheus, but when he heard that the Argonauts were gathering for Colchis he hastened to join them, accompanied by Hylas.

177. **The Fifth Labour** was to cleanse in one day the stables of Augeias, King of Elis, who had more cattle and sheep than any man on earth. The dung had not been cleared away for years. Heracles swore a bargain with Augeias that he would cleanse the stalls in one day in return for a tenth of the cattle, and Phyleus, son of Augeias, was a witness to their mutual oaths. Heracles then diverted the Rivers Peneius and Alphaeus through the stalls, which were thus cleansed in a day. But Augeias now learned that Heracles had been under Eurystheus' orders, and therefore refused the reward and even denied the bargain. When Phyleus was loyal to the truth Augeias banished him. Heracles later avenged himself on Augeias.

178. **The Sixth Labour** was to free the marshy lake of Stymphalia in Arcadia of the Stymphalian birds which were sacred to Ares. These man-eating creatures had brazen beaks, claws, and wings, and used their feathers as arrows. Heracles, helped by Athene, frightened the birds with a rattle and then shot them down, though some say that they flew off to the island of Aretius in the Black Sea, where they were found later by the Argonauts.

179. **The Seventh Labour** was to capture the Cretan bull. Poseidon had sent the bull to Minos for a sacrifice, but he had substituted another, and it was now raging over the island. Heracles did not avail himself of Minos' offers of help, but captured the bull single-handed and took it to Eurystheus, who set it free again. It roamed through Greece to Marathon, where Theseus captured it and took it to Athens for sacrifice to Athene.

180. **The Eighth Labour** was to bring back the mares of Diomedes, a savage King of the Bistones in Thrace, who fed his horses on human flesh. On his way Heracles visited Admetus and freed Alcestis from death. Then with a few companions he drove the mares down to the sea, and turning to repel the attacking Bistones, he left them in the charge of his friend Abderus, who was soon eaten by them. Heracles, however, killed Diomedes and threw his body to the mares. He then founded the city of Abdera in honour of his friend and drove the mares back to Eurystheus, who set them free on Mt. Olympus, where they were eaten by wild beasts.

181. **The Ninth Labour** was to fetch for Admete, daughter of Eurystheus, the golden girdle that Hippolyte, Queen of the Amazons, had received from Ares. After an eventful journey through Europe and Asia, Heracles and his companions reached the land of the Amazons, where Hippolyte, sister of Antiope, received him kindly and promised him the girdle. But Hera roused the Amazons, and they attacked Heracles In the fight he killed their leaders and Hippolyte herself, from whom he took the girdle On his way home Heracles came to Troy, where he rescued Laomedan's daughter Hesione from a sea monster sent by Poseidon.

182 **The Tenth Labour** was to fetch the oxen of Geryon without either demand or payment Geryon, a powerful monster with three bodies, lived on the island of Erythia. Its site was disputed Some said it was beyond the ocean stream. Others identified it with Gades Heracles travelled to the frontiers of Libya and Europe, where he set up two pillars, Calpe and Abyla, on the two sides of the Straits of Gibraltar, hence called the "Pillars of Hercules" When Helios shone too brightly, Heracles shot at him with an arrow, and Helios, admiring such boldness, gave him a golden cup or boat in which he sailed to Erythia. Geryon's cattle were guarded by the two-headed dog Orthrus, said to be the offspring of Typhon and Echidne, and the herdsmen Eurytion, son of Ares Heracles felled both of these with his club, and, after overcoming Geryon, he sailed with the cattle to Tartessus in Spain, where he returned the golden boat to Helios On his adventurous journey back through Gaul, Italy, Illyricum, and Thrace, he resisted many attempts, such as that of Cacus, to steal the cattle and eventually handed them over to Eurystheus, who sacrificed them to Hera.

183. **The Eleventh Labour** was to fetch the golden apples of the Hesperides. These grew on the tree which Hera had received from Ge at her wedding and which she had planted in a garden on Mt. Atlas. It was guarded by the Hesperides and the dragon Ladon, another offspring of Typhon and Echidne. Heracles first consulted Proteus, or as some say Prometheus, and, following the advice he received, he persuaded Atlas to fetch the apples, while he himself upheld the celestial globe. According to some, he also shot Ladon. Atlas, returning with three apples, tried to avoid taking back the burden of the globe, but Heracles, by a ruse, transferred the globe back to the giant's shoulders, took the apples, and hastened away. On his return journey he killed the giant Antæus, and also persuaded Zeus to free Prometheus, the arrow with which Apollo shot the vulture being placed among the stars as

Sagitta. Eurystheus made Heracles a gift of the apples, but the hero dedicated them to Athene, who returned them to their rightful place.

184. The Twelfth Labour was to bring back the dog Cerberus from Tartarus, the most difficult task of all. Heracles descended from Tænarum in Laconia and was guided by Athene and Hermes. After he had crossed the Styx and freed his friend Theseus and Ascalaphus, he obtained Hades' permission to carry away Cerberus, provided he could do so without using any weapon. Heracles seized Cerberus by the throat and dragged him up to show Eurystheus. He then carried the monster back to Tartarus.

185. According to most writers Heracles now returned to Thebes and gave his wife Megara to his nephew Iolaus, but Euripides, in his play *Heracles*, uses a different version. He represents the hero first killing the tyrant of Thebes, who had attempted to kill Megara and her children, and then, driven insane by Hera, himself killing his wife and family.

186. Heracles now desired to marry Iole, daughter of his friend Eurytus, King of Œchalia. Eurytus had promised her to the man who could surpass him and his sons in shooting with the bow. Though Heracles surpassed them all, Eurytus still refused to give him Iole because he had murdered his own children, and in this Eurytus was supported by all his sons except Iphitus. Later when Iphitus appeared suspicious of him, Heracles in a frenzy of rage slew him. Though purified from this murder, he was still troubled in mind, and consulted the Delphic Oracle. He was advised to serve as a slave and to give the proceeds to the family of Iphitus.

187. Heracles was purchased by Omphale, Queen of Lydia, and widow of Tmolus, and he served her either for one or for three years. Later writers say that he lived effeminately at this time, and that he used to change garments with Omphale, but others say that he continued to perform heroic deeds.

188. His period of servitude to Omphale completed, Heracles sailed against Troy. On a previous occasion, probably when returning from the land of the Amazons, Heracles and his friend Telamon had come to Troy, where they had found Laomedan's daughter, Hesione, exposed naked to a sea-monster, sent by Poseidon (*see para* 104). Heracles had freed Hesione and killed the monster, but Laomedan had refused to give him the reward he had promised, the white horses given by Zeus in exchange for Ganymede.

189. Heracles and Telamon therefore now sailed to Troy to take their revenge. How they sacked the city is described in para 275. Hesione was given to Telamon and bore him the son Teucer. On his return, Heracles faced a terrible storm raised by Hera and perils on the island of Cos. He was then led by Athene to Phlegra, where he helped the gods in their battle with the giants.

190. Heracles now took his revenge on Augeias, who had refused him payment for cleansing the stables. He invaded Elis and eventually killed Augeias, his sons, and their allies, the Moliones, though some say that he spared Augeias. He then founded the Olympic Games, and fetched from the source of the Danube the wild-olive tree whose leaves should crown the victor. Heracles then destroyed the city of Pylus, which had helped Elis. He killed Neleus the king and all his sons except Nestor.

191. Heracles next marched against Hippocoon who had fought against him under Neleus. Hippocoon had driven out his brother Tyndareus and seized the kingdom of Sparta. Heracles killed him and all his sons, and restored Tyndareus. He was helped in this enterprise by Cepheus and his twenty sons, but Cepheus and seventeen sons were killed. It was about this time that Heracles seduced the priestess Auge, daughter of Aleus, King of Tegea, and became by her the father of Telephus.

192. After four years in Arcadia, Heracles left for Ætolia, where Œneus was King of Calydonia and Pleuron. Heracles wished to marry Œneus' daughter Deianeira and won her by defeating Achelous, the mighty river-god, son of Oceanus and Tethys. He now sent Iolaus as leader of his sons by the daughters of Thespius to settle in Sardinia.

193. Three years later, while at a feast, Heracles accidentally killed the boy Eunomus, and went into voluntary exile, taking Deianeira and their son Hyllus.

194. They reached the River Evenus, across which the centaur Nessus carried travellers for a small fee. Heracles let Nessus carry Deianeira, while he himself swam, but the centaur galloped off with her and would have violated her if Heracles had not shot him through the breast. The dying centaur then told Deianeira to take his blood as a charm to keep Heracles' love.

195. Heracles now resided at Trachis, and from there invaded Œchalia with an army in order to avenge himself on Eurytus, who had refused to surrender his daughter Iole, even though Heracles had won her in the archery contest. The hero killed Eurytus and all his family, and sent Iole to Deianeira in Trachis while he visited Cenæum in Eubœa and prepared a thanksgiving sacrifice to Zeus.

196. He had sent Lichas to Deianeira to fetch a white shirt to wear at the ceremony. Deianeira, fearful that Iole might win Heracles' love, rubbed the shirt in Nessus' blood, not knowing that Heracles' arrow, steeped in the Hydra's blood, had poisoned it. When Heracles put the shirt on, it burned with excruciating agony into his body, and attempts to tear it off took his flesh with it. Heracles seized Lichas and flung him into the sea and then commanded his son Hyllus to take him to Trachis. Deianeira, aghast at what she had unintentionally done, hanged herself. Heracles asked Hyllus to promise to marry Iole and to build him a funeral pyre on Mt Œta.

197. This tragic climax to Heracles' career has been dramatised by Sophocles in the *Women of Trachis*, or *Trachiniæ*, where Deianeiras' distress at Ioles' arrival and her ill-fated ruse to keep her husband's love are touchingly represented.

198. Heracles finally ascended his funeral pyre to be burned alive. To Philoctetes, who kindled the flame, he gratefully bequeathed his quiver, bow, and arrows. Thunderbolts demolished the pyre, and Heracles was carried by a cloud to Olympus. There he became immortal. Hera was persuaded by Zeus to adopt him as her son, and reconciled to her at last, he married her daughter Hebe.

THE CHILDREN OF HERACLES, OR HERACLEIDÆ.

199. Eurystheus now determined to expel from Greece Alcmene and all the children of Heracles. Only in Athens did they find protection, and when Eurystheus attacked the city he was resisted by Theseus (or by his son Demophon), Iolaus, and Hyllus. As an oracle had demanded the sacrifice of one of Heracles' children, his daughter Macaria killed herself. Eurystheus was then defeated, by either Iolaus or Hyllus, and despatched by Alcmene.

200. These events are the theme of Euripides' play, *The Children of Heracles* or *Heracleidæ*.

201. Hyllus later, endeavouring to enter Peloponnesus, was slain in single combat by Echemus, King of Tegea. Only Tleopolemus settled in Argos.

202. Some generations later, the descendants of of Heracles conquered Peloponnesus in conjunction

with the Dorians. This legend indicates the conquest of the Achæans by the later invaders.

THESEUS, 203–218.

203. Theseus, the great hero of Attica, was the son of Æthra by Ægeus, King of Athens, though he was also reputed to be the son of Poseidon Æthra was the daughter of Pittheus, King of Troezen and here she secretly brought up her young son.

204. When he was of age, Æthra showed him the sandals, and a sword which was an heirloom of Cecrops, that Ægeus had left for him under a great rock. Theseus was able to lift the rock, recover the tokens, and proceed to Athens.

205. He insisted on going not by sea, but by the dangerous land route, and, like Heracles, he freed the country of many terrors. He killed Periphetes, whose club he afterwards carried, Sinis, the the wild sow of Crommyum, Sciron, Cercyon, and Sinis' father Polypemon, who was surnamed Procrustes.

206. Meanwhile in Athens Ægeus had married Medea, who had fled for safety from Corinth Medea recognised Theseus, and jealous for Medus, her son by Ægeus, she attempted to poison him But Ægeus recognised Cecrops' sword in time and welcomed his son with great rejoicing. Medea fled, taking Medus, and Theseus then scattered other rivals, the fifty sons of Pallas, nephews of Ægeus, who had hoped to succeed him to the throne.

207. Theseus next captured and sacrificed to Athene, the Marathonian bull which Heracles had brought from Crete and which had been driven to Marathon.

208. He now, of his own free will, went as one of the seven youths who with seven maidens were chosen by lot to be sent to Crete as yearly tribute, to be devoured there by the Minotaur. But Ariadne, daughter of Minos, King of Crete, fell in love with Theseus, and gave him a sword and a clue of thread by which he might find his way out of the labyrinth where the Minotaur lived Theseus slew the monster, released his fellow Athenians, and fled with them and Ariadne, but at Naxos he deserted her and she was consoled by Dionysus, to whom the island was sacred.

209. Theseus forgot on his return to hoist the white sail which was to have been a sign of victory, and Ægeus, seeing the black sail, threw himself in despair into the sea now called Ægean Theseus then became the King of Athens

210. He is said to have invaded the country of the Amazons either with Heracles or later, and here he carried off Antiope, who became his wife, though according to another tradition, Theseus took not Antiope but her sister Hippolyte. It is "Hippolyta" who appears as his bride in *The Midsummer Night's Dream* In revenge the Amazons invaded Attica, and were eventually defeated by Theseus in the midst of Athens itself

211. Later Theseus married Ariadne's sister Phædra, another daughter of Minos, who bore him the sons Acamas and Demophon. But Phædra fell desperately in love with her step-son Hippolytus (Theseus' son by either Antiope, or Hippolyte), and when the young man rejected her advances she killed herself, after leaving a letter falsely accusing him to Theseus. The enraged Theseus prayed to Poseidon that Hippolytus might die that very day, and the god sent a sea-monster which so terrified the chariot horses of Hippolytus that they dragged him to death The story is the theme of Euripides' tragedy *Hippolytus*, and the *Phedre* of Racine.

212. Theseus was a close friend of Pirithous, King of the Lapithæ, and attended his wedding to Hippodameia, and when a drunken Centaur attempted to carry off the bride, Theseus joined with the Lapithæ in the famous fight against the Centaurs.

213. After Hippodameia's death, Pirithous and Theseus together carried off the girl Helen of Sparta, and she fell by lot to Theseus. As she was too young to marry, he concealed her in the village of Aphidnæ, where she was cared for by his mother Æthra.

214. Theseus then, full of misgiving, fulfilled his promise to Pirithous to help carry off another daughter of Zeus, by accompanying him to the Underworld to take away Persephone. But Hades chained them both to a rock, where they languished till Heracles came to the Underworld and released Theseus only (*see para.* 184).

215. Meanwhile Helen's brothers, the Dioscuri Castor and Polydeuces, invaded Attica, and being told by Academus where Helen was hidden, they rescued her, taking Æthra as her slave.

216. When Theseus returned from Tartarus he was unable to keep order among his people, who were being stirred up against him by Menestheus He retired to the island of Scyros, where he was treacherously killed by King Lycomedes He nevertheless returned in spirit to help the Athenians at the Battle of Marathon, and though Menestheus succeeded Theseus as king, the sons of Theseus were afterwards restored to the throne.

217. Theseus, like Heracles, took part in the heroic enterprises of his age He joined in the Calydonian hunt and helped Adrastus at Thebes, and he may have been one of the Argonauts.

218. Although Athenians in later times looked on Theseus as an historical figure, ascribing political institutions to him, he was in fact a legendary hero.

CRETAN MYTHS, 219–239.

219. Recent archæological discoveries have indicated that many of the ancient legends concerned with Crete have a factual basis, and a very readable book on the subject is the "Pan" Book *Bull of Minos*, by Leonard Cottrell.

220. In 1899 Sir Arthur Evans began his excavations at Cnossos and soon unearthed the remains of the magnificent, unfortified and labyrinthine so-called "Palace of Minos" with its indications of an elegant and highly artistic civilisation.

221. From the architectural evidence available, scholars now consider that there existed in Crete between 2500 and 1400 B.C., a "Minoan" pre-Hellenic culture which had affinities with that of Egypt. This maritime, commercial culture, its sea-power making fortification unnecessary, spread to the mainland of Greece, where it became known as Mycenæan. It is in fact possible that Crete may have exercised some kind of suzerainty over the mainland. The Cretans probably worshipped a goddess who was served by priestesses The favourite sport was bull-fighting, in which men and women toreadors showed amazing skill Cretan architects and engineers were exceptionally ingenious.

222. Discoveries such as these give special significance to such legends as that of Minos' sea power, and of Crete's exaction from Athens of a tribute of men and maidens for the Minotaur. Again the constant appearance of the bull in Cretan legend and Dædalus' building of the labyrinth appear to have foundation in historical fact.

223. It was to Crete that Zeus, in the form of a bull, brought Europa, said to be the daughter of Agenor, son of Poseidon and King of Phœnicia, and of his wife Telephassa.

224. As the lovely Europa was playing on the sea-shore with her maidens, Zeus appeared as a white bull and she dared to climb on his back, an incident depicted in the masterly painting by

Paul Veronese in the Palace of the Doges in Venice. Suddenly Zeus, plunging into the sea, carried off Europa to Crete, where he fathered on her the three sons, Minos, Rhadamanthus, and Sarpedon. When the reigning king later married Europa he adopted her three sons as his heirs.

225. The brothers quarrelled, however, over the boy Miletus, son of Apollo. As Miletus preferred Sarpedon, they both fled from Minos to Asia Minor. Here Miletus founded the kingdom that bore his name, and Sarpedon, after aiding Cilix, King of Cilicia, against the Lycians, became king of the latter and was permitted by Zeus to live for three generations.

226. Rhadamanthus, though at first ruler of part of Crete, also found it wise to flee. He went to Bœotia, and on Amphitrion's death married Alcmene. So just a ruler did he prove, that he became one of the judges of the Underworld.

227. Minos, now sole ruler of Crete, was confirmed in his power by Poseidon, who sent him a magnificent white bull. This so delighted the king that he withheld it from sacrifice, and when it later ran savage it was captured by Heracles as his Seventh Labour, and eventually slain by Theseus.

228. Minos was the law-giver to Crete and was helped in the defence of the island by Talos, a bull-headed, brazen giant and by his powerful fleet.

229. Curious legends are told of Minos' loves. One was Procris, another Britomartis, a Cretan nymph whom he pursued for nine months, until she leaped into the sea and was deified by Artemis, sharing with her the epithet Dictynna.

230. Once when Minos was besieging Nisa, the port of Megara, which belonged to King Nisus, Scylla, Nisus' daughter, fell in love with him, and killed her father by cutting off the hair on which his life depended. Although Scylla let him into the city, Minos was so horrified at her parricide that he left her, and she swam after his ship until her father's soul, changed to a sea-eagle, pounced on her, and she was turned to the bird Ciris. Others say that Minos drowned Scylla, and she was turned into the fish Ciris. She has sometimes been confused with Scylla the daughter of Phorcys.

231. The wife of Minos was Pasiphaë daughter of Helios and Persë and several of their children, as Glaucus, Androgeos, Ariadne, and Phædra were the subject of legend.

232. Glaucus when a boy was drowned in a cask of honey, and his body found by the seer Polyeidus. Unable to resuscitate Glaucus, Polyeidus was entombed with him, but here a serpent revealed a herb which restored Glaucus to life, and the seer and the boy were released.

233. Androgeos won every contest in the Panathenaic games and was slain at the instigation of Ægeus. Minos in revenge exacted from Athens a yearly tribute of seven youths and maidens to be devoured by the Minotaur.

234. This monster with bull's head and man's body, was the offspring of Pasiphaë and the white bull. Dædalus the craftsman had enabled her to satisfy her desire, and afterwards built the labyrinth in which her shameful offspring was housed.

235. When Ægeus' son Theseus voluntarily joined the youths destined for the Minotaur, Ariadne fell in love with him, and enabled him to kill the monster by giving him a sword and a clue of thread by means of which he found his way out of the labyrinth. Ariadne then escaped with Theseus, but was deserted by him on Naxos, where she was found by Dionysus, as depicted in Titian's "Bacchus and Ariadne" in the National Gallery. Tintoretto's picture in the Doge's Palace in Venice shows the marriage of Ariadne to the god.

236. Her sister Phædra was later married to Theseus, and her unrequited passion for her stepson Hippolytus and its tragic outcome has been described in para. 211.

237. The cunning Dædalus, whose craftsmanship was symbolic of the latest development in sculpture and architecture, had been welcomed by Minos after his flight from Athens. The legend runs that he had been so bitterly jealous of his nephew Talos, or Perdix, inventor of the saw, chisel, and compasses, that he threw him headlong from Athene's temple on the Acropolis. Athene changed Talos into the bird "perdix" or partridge, and the Areopagus banished Dædalus.

238. Welcomed to Crete, he found his skill greatly valued by Minos, until the king discovered how he had aided Pasiphaë. Minos then imprisoned Dædalus with his son Icarus in his own labyrinth. They were released by Pasiphaë, and Dædalus made wings fastened to the shoulders with wax on which they flew away. Icarus mounted too high, the sun melted the wax and he was drowned in the Icarian Sea, but Dædalus reached Cumæ near Naples, and fled thence to Sicily. Here Cocalus welcomed him, and when Minos pursued the craftsman, Cocalus' daughters enabled him ingeniously to kill the king.

239. After Minos' death, although his son succeeded him, Cretan civilisation collapsed. Minos himself became a judge in the Underworld.

THEBAN MYTHS, 240–271.

240. The legend concerning the origin of Thebes is that of Cadmus, who according to common tradition was the son of Agenor, son of Poseidon and the King of Phœnicia, and of his wife Telephassa.

241. The sister of Cadmus, Europa, was one day carried off by Zeus, who appeared to her in the form of a bull (as is described in para. 224) and Agenor sent Cadmus in search of his sister.

242. Unable to find her, Cadmus consulted the Delphic oracle, who advised him to relinquish his search but to follow a cow and build a town where she should sink down with fatigue. Cadmus followed the cow from Phocis to Bœotia, and where she rested he built Cadmea, later the citadel of Thebes.

243. Making sacrifice to Athene, he sent his men for water from a spring of Ares not knowing that it was guarded by a dragon which killed most of his men. When Cadmus had killed the dragon Athene advised him to sow its teeth, and immediately there sprang up, fully armed, the Sparti, or "Sown Men," who fought with each other till only five survived—Echion, Udæus, Chthonius, Hyperenor, and Pelorus. These five were the ancestors of Thebes, and with their help the Cadmea was built.

244. Zeus gave to Cadmus as wife Harmonia, daughter of Ares and Aphrodite, and the Olympian deities attended the wedding. Harmonia received as a gift from Aphrodite the famous necklace made by Hephæstus, which Zeus had originally given Europa, and which conferred irresistible loveliness upon its wearer. From Athene she received a magic robe which conferred divine dignity. The children of Cadmus and Harmonia were Autonoe, Ino, Semele the mother of Dionysus, Agave, Polydorus, and later Illyrius.

245. It is said that Cadmus introduced to Thebes from Phœnicia the use of letters.

246. In old age Cadmus resigned the throne to Pentheus, his grandson, the son of Agave and Echion. But Pentheus, resisting the worship of Dionysus, was destroyed by Agave and her sisters Autonoe and Ino, as is depicted in *The Bacchæ* of Euripides.

247. Cadmus and Harmonia then left Thebes and were later, in the form of serpents, received in the Islands of the Blessed.

248. Another legend concerning Thebes is that of Amphion and Zethus the twin sons of Antiope by Zeus.

249. Antiope was divorced by her husband Lycus of Thebes, and cruelly treated by his second wife, Dirce. Meanwhile Amphion and Zethus were brought up by cattle men on Mt. Cithæron. When they were old enough to know what had happened they took their revenge. They killed Lycus and Dirce, who was tied to the horns of a wild bull and her body thrown into a fountain which henceforth bore her name, and then took possession of Thebes.

250. Amphion and Zethus now built the lower fortifications below the Cadmea, and so skilfully did Amphion play on the lyre given him by Hermes that the stones moved into place of their own accord. The brothers ruled jointly. Zethus married Thebe, who gave her name to the city, and Niobe became the wife of Amphion.

251. Niobe, the proud daughter of Tantalus and sister of Pelops, had seven sons and seven daughters, and boasted that she was superior to Leto, who had only two children. As punishment to her, Apollo killed the boys with his arrows, and Artemis the girls, and Niobe "all tears" was turned by Zeus into a stone on Mt Sipylus. The crag of Niobe, being snow-capped, appears to weep when the sun strikes the snow. It is said the Amphion also was either killed by Apollo or that he took his own life

252. Most famous of Theban kings was Œdipus, who claimed direct descent from Cadmus through Polydorus, Labdacus, and Laius, and all three of the great Greek tragic dramatists were inspired by the fateful story of Œdipus and his children.

253. Œdipus the son of Laius, King of Thebes, and of his wife Jocasta, was as a new-born child exposed on Mt Cithæron, his feet tied together and pierced with a nail, for Laius had learned from the oracle at Delphi that he would be killed by his own son. Found by a shepherd of Polybus, King of Corinth, the child was called from his swollen feet Œdipus, and was reared by Polybus as his own son.

254. When Œdipus grew to manhood, he was told by the Delphic oracle that he was destined to kill his own father and marry his mother, and he resolved never to return to Corinth. But going from Delphi, he met Laius riding in a chariot, and in a quarrel killed him.

255. Laius had been on his way to ask the Delphic oracle how he could rid Thebes of the Sphinx, a winged lion with the head and breast of a woman. This monster was said to be the offspring of Typhon and Echidne, or of Orthrus and the Chimæra. Seated on a rock, she challenged each wayfarer with her riddle and strangled him when he failed to solve it.

256. Œdipus, arriving in Thebes, heard the Sphinx's riddle. "Which being, having only one voice, has sometimes two feet, sometimes three, and sometimes four and is weakest when it has most." Œdipus answered rightly that the being was man, who crawls in infancy and supports himself with a staff in old age, and the Sphinx thereupon flung herself to death.

257. As the Thebans had promised that whoever should vanquish the Sphinx should become king and marry Jocasta, Œdipus became King of Thebes and had four children by his own mother, Eteocles, Polyneices, Antigone, and Ismene.

258. Thebes, thus defiled by murder and incest, was visited by plague and the blind seer Teiresias said that the city would be saved when one of the "Sparti" (a title given also to descendants of the "Sown Men") should give his life. When he learned this, Menœceus, father of Jocasta, leapt from the walls to his death.

259. The plague still raging, Œdipus consulted Teiresias, and it is at this point that the famous *Œdipus Tyrannus* of Sophocles begins. Œdipus was horrified when at last convinced of his unconscious guilt and, after Jocasta had hanged herself, he blinded himself with a pin taken from her garment and prayed her brother Creon to banish him.

260. Eventually Œdipus went into exile accompanied by Antigone, and followed later by Ismene. At Colonos in Attica he found refuge in a grove of the Eumenides and, protected by Theseus, was received at last by the gods. These last hours of Œdipus are most touchingly presented by Sophocles in his *Œdipus at Colonos*.

261. Angered by his sons' neglect, Œdipus had cursed them, saying that they should divide their inherited land by the sword. They therefore agreed to rule in turn, but when Eteocles' term had expired he refused to abdicate. Polyneices then sought the help of Adrastus, son of Talaus and King of Argos, whose daughter Argia he married, while her sister Deipyle married Tydeus (son of Œneus of Calydon), who, on account of some murder he had committed, was also a fugitive.

262. When Adrastus prepared to restore Polyneices, his brother-in-law, the seer Amphiaraus, prophesied death for all the leaders save Adrastus. Amphiaraus had married Adrastus' sister Eriphyle, and Polyneices, following the advice of Tydeus, bribed Eriphyle, giving her the famous necklace of Harmonia on the condition that she would persuade her husband to join the expedition.

263. Adrastus, Amphiaraus, Polyneices, and Tydeus were joined by Capaneus, Hippomedon, and Parthenopaeus, the son of Meleager and Atalanta, and these seven marched against Thebes. The war that followed was dramatised by both Æschylus, in his *Seven against Thebes*, and by Euripides, in *The Phœnician Maidens*.

264. After Thebes had suffered initial reverses, Teiresias prophesied that a royal prince must sacrifice himself, and a second Menœceus, the son of Creon, now took his own life.

265. The attackers were soon repelled. Capaneus, scaling the walls, was struck by Zeus with lightning. Tydeus, wounded by Melanippus, might have been saved by Athene with an elixir given her by Zeus, but Amphiaraus, who bore him a grudge, persuaded him to drink the brains of the dead Melanippus. This so disgusted Athene that she left him to his fate. Hippomedon and Parthenopæus also having been killed, offered to settle the dispute in single combat with Eteocles, but both were mortally wounded. Amphiaraus fled in his chariot and the earth opened and swallowed him. As the seer had prophesied, Adrastus was the only one of the seven left alive.

266. Thebes was not unscathed. The *Antigone* of Sophocles opens at the point where Creon refused to allow burial to Polyneices. The courageous Antigone dared to disobey him and he ordered that she should be imprisoned alive in a cave. Here she hanged herself, and Creon's son Hæmon, to whom she was betrothed, took his own life in despair.

267. Euripides, in *The Suppliants*, dramatises the next phase of the story. Since the Thebans had refused burial to their fallen enemies, Adrastus and the mothers of the slain went to Eleusis and secured the help of Theseus. He defeated the Thebans, and the bodies of the Argives received burial rites, but Evadne, daughter of Iphis and wife of Capaneus threw herself on to the flaming pyre and perished.

268. Thebes was again attacked ten years later, when Adrastus assembled the "Epigoni," the descendants of the "Seven." His own son Ægialeus made one, and also Diomedes, son of Tydeus, with his faithful companion Stheneleus, son of Capaneus and Evadne.

269. Since Alcmæon, like his father Amphiaraus, was unwilling to join the Epigoni, Thersander followed the example of his father Polyneices in

once more bribing Eriphyle, this time with the magic robe of Harmonia. She then persuaded Alcmæon to join the expedition along with his brother the seer Amphilochus.

270. Ægialeus was killed before the walls of Thebes, and Teiresias then advised the Thebans to evacuate the city and himself accompanied them, though he died next dawn on drinking from the well of Tilphussa. That day Adrastus, hearing of Ægialeus' death, also died of grief, and in accordance with Teiresias' prophecy the Argives took the empty city.

271. Alcmæon, on return, slew his mother Eriphyle, in revenge for her vanity and deceit towards his father and himself. Pursued by the Erinnyes, he fled to Phlegeus, King of Psophis, who purified him and gave him his daughter Arsinoë in marriage. Alcmæon gave his wife Harmonia's necklace and robe, but was soon forced by the Erinnyes to flee once more. He was next purified by the river-god Achelous and married his daughter Callirrhoë, who soon demanded the necklace and robe. Alcmæon, daring to revisit Psophis, obtained them from Phlegeus on the pretext of taking them to Delphi, but when Phlegeus discovered that they were destined for Callirrhoë he ordered his sons to slay Alcmæon. Finally, Phlegeus himself sent the ill-fated treasures to Delphi.

LEGENDS OF TROY, 272–352.

272. One of the most romantic discoveries of modern times is that of the German Schliemann, who, trusting the descriptions of Homer, excavated a site on the coast of Asia Minor, near the entrance to the Dardanelles. Between 1871 and 1873 he unearthed the foundations not of one Troy but of seven, his most spectacular find being a hoard of exquisite gold ornaments. His work proved that Troy belonged not only to legend but also to history.

273. It is now considered that in the Bronze Age Troy was an important centre for trade. Frequently attacked, it was many times rebuilt, and Greeks, Cretans, and Phrygians all claimed to have had a hand in establishing it. In Homer's time, when the sixth Troy was standing, it had probably absorbed three small towns, Dardania, Tros or Troy, and Ilium, and was probably inhabited by three tribes, Dardanians, Trojans, and Ilians, whose names are all represented in the early legends of Troy's foundation.

274. One of these tells how Scamander of Crete founded a colony in Phrygia, and how, jumping into the River Xanthus, he changed its name to his own. The nymph Idæa bore him a son Teucer (whence the Trojans are called Teucri), and Teucer gave a piece of land to Dardanus, the son of Zeus by the Pleiad Electra, who built there the town of Dardania. The grandson of Dardanus was Tros, who became the father of Ilus and also of Ganymede, whom he relinquished to Zeus for a gift of horses. The son of Ilus was Laomedan.

275. It was to Laomedan that Zeus assigned Apollo and Poseidon as labourers. They built for him the walls of Troy, and when Laomedan refused payment, Poseidon sent the sea-monster, which would have devoured his daughter Hesione had not she been rescued by Heracles. But again Laomedan refused the agreed reward—the white horses given by Zeus in exchange for Ganymede—and Heracles returned later to sack Troy. He gave Hesione to his fellow-warrior Telamon, and killed Laomedan and all his sons save Podarces, who was ransomed by his sister Hesione, and his name changed to Priam, which means "redeemed."

276. After a few years Priam sent Antenor to demand that Telamon should send back Hesione, and the Greeks' scornful refusal was one of the causes of the Trojan War.

277. Priam had fifty sons, nineteen of them by his second wife Hecabe, or Hecuba, who bore him many famous children, including Hector, Paris, Deiphobus and the prophetic twins Helenus and Cassandra. Troilus may have been her son by Apollo.

278. Before the birth of her second son, Hecuba dreamed that she had brought forth a blazing firebrand, and the new-born child was therefore exposed on Mt. Ida. Brought up by a shepherd, he was called Paris, and later, by his courage earned the name Alexander or "defender of men." Paris was beloved by the nymph Œnone, but he deserted her as the result of a tempting suggestion of Aphrodite's.

279. The occasion of this was the famous "Judgment of Paris," of which a Renaissance version can be seen in Rubens' picture in the National Gallery.

280. The story goes that alone of all the gods, Eris was not invited to the marriage of Peleus and Thetis, and in revenge she flung in the golden apple of discord with "to the fairest" inscribed upon it. Immediately Hera, Athene, and Aphrodite disputed its possession, and Zeus commanded Hermes to lead the goddesses to Mt. Ida for Paris to judge the dispute.

281. Although Hera promised him rule in Asia, and Athene fame in war, Paris gave the apple to Aphrodite, who promised him as his wife the loveliest of all women.

282. Paris now discovered his parentage and was joyfully welcomed by Priam, and under Aphrodite's protection sailed to Sparta.

283. His sister Cassandra foretold doom, but was as usual unregarded. In her youth she had been loved by Apollo, who had taught her the art of prophecy on condition that she became his lover. But she had disappointed him, and Apollo had then ordained that her prophecy should never be believed.

284. Welcomed to Sparta by King Menelaus, Paris fell in love with his beautiful queen, Helen, and in Menelaus' absence he succeeded in carrying her off to Troy with much treasure, thus precipitating the Trojan War, now inevitable by reason of an oath sworn by the leading chieftains of Greece to defend Helen's husband.

285. Helen, the daughter of Leda by Zeus, had been brought up in the Court of Leda's husband, Tyndareus of Sparta. So lovely was she that even as a young girl she had been carried off by Theseus and Pirithous, to be rescued and brought back by her brothers, the Dioscuri. All the noblest in Greece then became rivals for her hand, and at the instigation of Tyndareus swore an oath to defend her chosen husband.

286. Helen married Menelaus, and when the Dioscuri were immortalised, he succeeded Tyndareus as King of Sparta.

287. After Helen had fled with Paris, leaving her husband and daughter Hermione, Menelaus summoned the chieftains to war. His powerful brother Agamemnon, King of Mycenæ, who had married Helen's half-sister, Clytemnestra, was leader, and from the Peloponnese came also old Nestor of Pylus, whose Palace has only recently been discovered. Nestor was the only one of Neleus' twelve sons spared by Heracles. Renowned for wisdom and eloquence, he had been a courageous fighter. He had defeated the Arcadians and Eleans and had taken part in the Calydonian hunt and the fight between Centaurs and Lapithæ. Although he had ruled over three generations, he gladly joined the expedition to Troy.

288. The courageous Diomedes, son of Tydeus, and King of Argos, also came from the Peloponnese with eighty ships. He had been one of the Epigoni who had taken Thebes, and two fellow Epigoni came with him—Sthenelus, son of Capa-

neus, and Euryalus, the Argonaut. Tleopolemus, son of Heracles, the Argive who had settled in Rhodes, brought nine ships, and Palamedes, son of Nauplius, joined the muster from Eubœa.

289. But Agamemnon needed more distant allies, and together with Menelaus and Palamedes, he went to Ithaca to persuade Odysseus to join them.

290. Odysseus was the son of Anticleia, a daughter of the wily thief Autolycus, and of Lærtes, King of Ithaca, though some say that his father was really Sisyphus. He had won his wife Penelope, daughter of King Icarius of Sparta, in a foot race, and when Icarius had tried to persuade Penelope to remain with him, Odysseus had told her she might do as she wished. Penelope had veiled her face to hide her blushes and had followed her husband to Ithaca.

291. An oracle had warned Odysseus not to join the expedition to Troy, and when the envoys arrived they found him ploughing and sowing salt But the far-sighted Palmedes placed Odysseus' infant son Telemachus in front of the plough, and Odysseus was tricked into revealing his sanity and joining the expedition.

292. Agamemnon also welcomed allies from Salamis and Locris From Salamis, bringing twelve ships, came Great Ajax, son of King Telamon, a courageous fighter, who boasted that he needed not the help of the gods. His half-brother, Teucer, son of Telamon by Hesione and the best archer in Greece, fought behind Great Ajax' shield. Little Ajax also fought with them Son of Oileus, King of the Locrians, he was small in stature but swift of foot, and skilled in throwing the spear He brought forty ships.

293. An important contingent from Southern Thessaly also sailed to Troy, for Calchas, a renegade prophet from Troy, foretold that the city could not be taken without the help of Achilles, son of Peleus, King of the Myrmidones at Phthia in Thessaly, and of the Nereid, Thetis.

294. By dipping her son into the Styx, Thetis had made him invulnerable, except for the heel which she was holding Achilles had been taught by Cheiron and by his tutor Phœnix, and was renowned for strength, speed, and high courage.

295. Thetis, knowing that if Achilles went to Troy he would never return alive, sent him disguised as a girl to the Court of Lycomedes, King of Scyros, and here Lycomedes' daughter Deidamia bore him the son Neoptolemus, or Pyrrhus. When Odysseus, accompanied by Nestor and Ajax, visited Scyros, he left a spear and shield among a pile of gifts for the maidens, and Achilles, seizing these, revealed his identity.

296. Achilles joined the Greeks together with his tutor Phœnix and Patroclus, his cousin, who had come as a boy to Peleus' Court after an accidental murder and had become the inseparable friend of Achilles.

297. The Greeks were further strengthened by Idomeneus, King of Crete, who brought 100 ships and shared the command with Agamemnon. Meriones accompanied Idomeneus.

298. The fleet was fortunate in being abundantly supplied with provisions, by Anius, son and priest of Apollo in Delos, for his three daughters who had been dedicated to Dionysus received from the god power to produce at will corn, oil, and wine.

299. The expedition set out from Aulis, but first made a false landing and ravaged the country of Telephus, son of Heracles and Auge, and now King of Mysia. When he repelled the Greeks, Dionysus caused him to stumble over a vine, and he was wounded by Achilles Told by an oracle that his wound could be cured only by him who had inflicted it, he visited the Greeks, who likewise knew through an oracle that they could not take Troy without the aid of Telephus. Achilles therefore gladly cured him with rust from the spear which had injured him, and Telephus showed the Greeks the route they should take.

300. Assembled a second time at Aulis, the Greeks were delayed by unfavourable winds, for Agamemnon, by killing a hart, had vexed Artemis. Calchas foretold that only the sacrifice of Agamemnon's daughter Iphigeneia would appease the goddess, and Agamemnon reluctantly gave his consent, though some say that Artemis snatched Iphigeneia from the altar and bore her off to Tauris (*see para* 396). Certainly the winds changed and the fleet set sail

301. When they landed on the island of Tenedos, in sight of Troy, Achilles killed King Tenes and his father Cycnus, and here Philoctetes, son of Poeas suffered misfortune Most famous of the Greek archers, he had been the friend of Heracles, and had received from him the famous bow and poisoned arrows when he set fire to the hero's funeral pyre on Mt Œta. He was now injured in the foot by one of these arrows or, as some say, by the bite of a snake, and the smell of the wound became so offensive that, on the advice of Odysseus, Philoctetes was left behind on the island of Lemnos.

302. It was probably from Tenedos that the envoys Menelaus, Odysseus and Palamedes were sent to Priam to request the return of Helen. They were courteously entertained by Antenor, the wisest of the Trojans, who advised that Helen should be sent back, but the Trojans were obdurate.

303. The Greeks then attacked the mainland, and Protesilaus of Thessaly, who was an uncle of Philoctetes, was the first to leap ashore, though he knew through an oracle that it meant death Wordsworth, in his poem *Laodamia*, tells how Laodamia his wife, the daughter of Acastus, desolate with grief, begged the gods to let her husband return for only three hours Hermes led Protesilaus to her, and when he died the second time she died with him.

304. Achilles, the second to land on Trojan soil, soon distinguished himself as the most courageous and formidable of all the Greeks.

305. It was through Achilles that Æneas entered the war At first he took no part, although he was the son of Priam's cousin Anchises. But when Achilles raided his herds on Mt. Ida, he led his Dardanians against the Greeks, and distinguished himself in battle His mother, Aphrodite, frequently helped him, and once carried him away when wounded by Diomedes, while the god Poseidon, though hostile to Troy, saved him from Achilles.

306. Many cities allied to Troy were raided by Achilles. In Thebes in Cilicia he killed King Eëtion, father of Hector's wife Andromache, while Great Ajax raided the Thracian Chersonesus and in Teuthrania killed the King Teuthras and took his daughter Tecmessa.

307. In the tenth year of the war the Greeks at last concentrated their armies before Troy itself, which was defended by the mighty Hector, by Æneas, and by many allies, including Sarpedon, a son of Zeus, who was in command of the Lycians.

308. The Greeks were hampered by rivalries between the chiefs. Odysseus took a cruel revenge on Palamedes, who had tricked him into joining the forces. He bribed one of Palamedes' servants to hide under his master's bed a letter written in the name of Priam, and then accused Palamedes of treachery Palamedes' tent was searched, the letter was found, and he was stoned to death by the whole army. Thus perished the sage, who was said to have invented lighthouses, scales, measures, the discus, certain letters of the alphabet, and dice.

309. Then in the tenth year there broke out the notorious quarrel between Achilles and Agamem-

non with which the *Iliad* opens. Chryseis, the daughter of the Trojan priest, Chryses had been taken prisoner and assigned to Agamemnon, and when Chryses came to ransom her, Agamemnon roughly repulsed him. Apollo, in revenge, sent a plague among the Greeks, and on Calchas' advice, Agamemnon unwillingly sent Chryseis back. He recompensed himself, however, by seizing Briseis, who had been given to Achilles, and Achilles then stubbornly refused to take any further part in the fighting, though some say that his motive in this was to curry favour with Priam, for he had fallen deeply in love with Priam's daughter Polyxena.

310. The Trojans quickly seized this opportunity to attack, and Agamemnon was glad to grant a truce so that Paris and Menelaus might settle the quarrel by a duel. But when Paris was losing, Aphrodite carried him away and fighting broke out again.

311. Diomedes wounded Æneas and Aphrodite and then strove with Glaucus, a Lycian prince second in command to Sarpedon, but when they remembered the friendship between their forefathers they desisted and exchanged gifts. Hector and Ajax fought in single combat till nightfall, when they also exchanged gifts, Hector giving Ajax a sword and receiving a purple baldric.

312. The Greeks, hard-pushed, were now forced to build a wall and trench, and when they were driven back even farther, Agamemnon in alarm offered to return Briseis to Achilles, but he courteously and firmly refused.

313. Diomedes and Odysseus then made a night-raid on the Trojan lines After killing the spy, Dolon, they slew Rhesus the Thracian and drove off his snow-white horses, for an oracle had declared that once they had drunk of Scamander, and eaten the grass of the Trojan plain, the city would not be taken. The play *Rhesus*, attributed to Euripides, dramatises these incidents from the *Iliad*.

314 Next day, however, the Trojans victoriously set fire to the very ships, and Achilles went so far as to lend Patroclus his own armour and let him lead the Myrmidones. After killing Sarpedon, Patroclus drove the Trojans back to their very walls, until he was at last himself wounded by Euphorbus, son of Panthous, and slain by Hector, who at once stripped him of his borrowed armour, though Menelaus, who had killed Euphorbus, now joined with Ajax in rescuing the body.

315. Achilles was prostrate with grief, but Thetis visited him with new armour made by Hephaestus, and he made peace with Agamemnon, who at last sent Briseis back Achilles then drove the terrified Trojans back to the city. The noble Hector alone withstood him, though Priam and Hecuba, implored him to come in. Thrice did Achilles chase Hector round the walls of Troy, and then finally killed him, stripped him of his armour, and, tying him by the ankles to his chariot, dragged him ignominiously back to the ship, though some say that Achilles dragged Hector three times round the walls of Troy by the purple baldric that Great Ajax had given him.

316. Each day at dawn Achilles, crazed with grief, pulled the corpse three times round the tomb of Patroclus until at last, in one of the most touching scenes of the *Iliad*, Priam, led by Hermes, went to Achilles' tent and begged to ransom his son's body for burial.

317. The lovely Penthesilea now came to the Trojans' aid. She was the daughter of Otrere and Ares, and Queen of the Amazons. But Achilles killed her, and as he mourned over her, he was ridiculed by Thersites, the ugliest and most scurrilous of the Greeks, and Achilles felled him with a blow. This angered Diomedes, a kinsman of Thersites, and he flung the body of Penthesilea into the Scamander, but it was rescued and honourably buried, some say by Achilles himself

318. Memnon the black-skinned, handsome son of Eos and Priam's half-brother Tithonus, and King of Ethiopia, now reinforced the Trojans. He killed several Greeks, including Antilochus, the gallant son of Nestor, who, too young to sail from Aulis, joined his father later.

319. The vengeful Achilles then engaged Memnon in fierce single combat while Zeus weighed their fates in the balance Memnon was slain and, at the request of Eos, Zeus honoured him by causing birds, called Memnonides, to rise from his funeral pyre and fight above it till they fell as a sacrifice. They were said to visit yearly the hero's tomb on the Hellespont.

320. Many great monuments, called Memnonia, were supposed by the Greeks to have been erected in Memnon's honour, the most famous being the colossal statue behind the temple of Egyptian Thebes, which gave forth each sunrise a sound like the breaking of a lyre-string.

321. Achilles' own course was now run, and in a battle near the Scæan gate Paris, aided by Apollo, shot him through the vulnerable ankle.

322. Great Ajax then killed Glaucus, and he and Odysseus rescued the body of Achilles. But they quarrelled violently over the possession of the armour Homer, in the *Odyssey*, says that Odysseus killed Ajax, and that when he summoned the spirits of the dead, Ajax held sullenly aloof. Sophocles, however, in his tragedy *Ajax*, represents Ajax thrown into madness by defeat and slaying the sheep of the Greeks, believing them to be his rivals, and finally falling on the very sword that Hector had given him.

323. So many heroes dead, the Greeks lost heart, and Calchas said they must fetch the bow and arrows of Heracles. Odysseus and Diomedes therefore sailed to the island of Lemnos, where Philoctetes had been left to languish, and Sophocles, in his play *Philoctetes*, shows how he was persuaded to return.

324. Cured of his wound by one of the sons of Asclepius, either Machaon or Podalirius, Philoctetes challenged Paris to an archery contest. Mortally wounded, Paris besought his former lover Œnone to cure him, but she refused, and then in remorse at his death took her own life, events described by Tennyson in his *Death of Œnone*.

325. Helenus and Deiphobus now quarrelled for the possession of Helen, now homesick for Sparta, and when Deiphobus forcibly married her, Helenus, as some say, fled to Mt. Ida, where either he freely joined the Greeks, or was captured or ensnared by Odysseus, for Calchas had said that only Helenus knew the secret oracles which protected Troy. Helenus said it would fall that summer, if a bone of Pelops were brought to the Greeks, if Achilles' son Neoptolemus, or Pyrrhus, joined them, and if Athene's Palladium were stolen from the citadel.

326. Agamemnon at once sent for the shoulder-blade of Pelops, while Odysseus, Phœnix, and Diomedes went to Scyros and persuaded Lycomedes to let Neoptolemus join them. Odysseus then gave Neoptolemus his father's armour.

327. It is said that Priam now sent Antenor to Agamemnon to sue for peace, but Antenor, out of hatred for Deiphobus, conspired with the Greek leader as to how they might secure the Palladium. They arranged that Odysseus, disguised as a filthy runaway slave, should gain entrance to Troy. Recognised by Helen alone, he gained much useful information, including the confession that she longed to return home. It was either on this occasion that he stole the Palladium, or later when he was accompanied by Diomedes.

328. Odysseus is said to have devised the stratagem of the wooden horse. This was built by the cowardly Epeius, son of Panopeus, under the supervision of Athene, and it bore an inscription

saying that it was dedicated to the goddess. Then twenty-three or more of the bravest Greeks, including Neoptolemus, Odysseus, Sthenelus, and Thoas of Calydon, climbed into the hollow belly.

329. At nightfall, Agamemnon and the remaining Greeks burnt their camp and sailed to the island of Tenedos, leaving behind only Sinon, a cousin of Odysseus and grandson of the cunning Autolycus.

330. At dawn Priam and his sons found the wooden horse on the shore, and believing it to be sacred to Athene, had it hauled in spite of opposition up to the citadel. Cassandra declared that warriors were within it, and she was supported by Laocoon, son of Antenor, and priest to both Apollo and Poseidon, who flung a spear at the horse's flank and caused a clatter of arms. Their warning was, however, neglected, partly because Sinon, who had let himself be taken prisoner, said that the horse was the Greeks' atonement for stealing the Palladium, partly because the fate which now befell Laocoon was misinterpreted.

331. Laocoon had offended Apollo by marrying in spite of vows of celibacy, and the god now punished him by sending two enormous serpents, which crushed to death both the priest and his two sons—a disaster represented in the magnificent sculpture probably dating from the first century B C. and now in the Vatican. Priam wrongly supposed this to be a punishment for smiting the horse, and it was now welcomed with feasting and revelry.

332. In the evening Helen with Deiphobus strolled round the horse and, imitating in turn the voice of each man's wife, she called to the heroes, who stifled their replies.

333. At night Agamemnon, warned by a beacon lit by Sinon, sailed to the shore, and as Antenor gave the word the warriors within the horse leapt down to slaughter and pillage.

334. Priam had been persuaded by Hecuba to take refuge with her and her daughters before an altar to Zeus, but their son Polites was slain before their very eyes by Neoptolemus, and when the old king feebly tried to attack the slayer, Neoptolemus butchered him also. Odysseus and Menelaus meanwhile killed and mangled Deiphobus, but Menelaus pardoned Helen, and led her safely to the ships.

335. Cassandra fled to the sanctuary of Athene, but Little Ajax roughly dragged her away, and she was claimed as booty by Agamemnon Her sister Laodice, the wife of Helicaon, was mercifully swallowed up by the earth.

336. Hector's widow Andromache was given to Neoptolemus, and the Greeks, eager to exterminate the whole family of Priam, even killed her infant son Astyanax, by hurling him to death from the city walls, fearful lest he should one day avenge his parents.

337. At the demand of Achilles' ghost Polyxena was sacrificed to him by Neoptolemus, to ensure favourable winds. Some say this happened at Troy, others only when the Greek fleet had reached Thrace.

338. Hecuba fell to the share of Odysseus, who took her to the Thracian Chersonesus, and there she avenged the death of one of her sons. Polydorus, the youngest of Priam's sons, had, according to Homer, been slain by Achilles, but later accounts speak of another son of the same name. Just before the fall of Troy Priam had entrusted him, together with much gold, to Polymester, King of the Thracian Chersonesus, and when Troy fell Polymester murdered Polydorus for his gold and cast him into the sea. Hecuba discovered the body. She contrived to kill Polymestor and his two sons, and she then evaded the angry Thracians by turning herself into a bitch named Mæra.

339. Euripides combined this story of Hecuba's revenge with that of the sacrifice of her daughter Polyxena in his tragedy *Hecuba*.

340. Few of the inhabitants of Troy escaped death or slavery. The wise Antenor, his wife Theano, and their children were all spared, and were said to have sailed to the West Coast of the Adriatic and there to have founded Venice and Padua.

341. Æneas' carried on his back his blind father Anchises through the Dardanian gate and so to safety. The Romans said that he took with him the Palladium, that stolen by Odysseus being only a replica, and, after seven years' wandering, reached Latium, where he founded Lavinia, and became their ancestral hero.

342. Æthra, the mother of Theseus, who had served Helen as a slave, was rescued by her grandsons, Acamas and Demophon, the sons of Theseus and Phædra.

THE RETURNS FROM TROY.

343. Part of the ancient "Epic Cycle" of the Greeks was the cycle known as "The Returns," which was used both by Homer and Æschylus It told of the adventures of the Greeks on their way home. Most suffered misfortune.

344. The fate of Agamemnon is described in para. 386–388, and that of Odysseus in para. 353–369.

345. Menelaus, who failed to sacrifice to Athene, took eight years, and only by seizing Proteus learned how to reach Sparta, where he married Hermione to Neoptolemus.

346. Neoptolemus had been accompanied by Andromache and by Helenus, who prophesied a safe route. He had abandoned his kingdom in Thessaly and settled in Epirus, part of which he gave to Helenus, who married Andromache. Neoptolemus then claimed Hermione, although her grandfather, Tyndareus, had betrothed her to Orestes, and as a result he was murdered, either by Orestes himself or at his instigation.

347. Many Greeks settled in Italy. Diomedes, hated by Aphrodite, finding on his return to Argos that his wife had been unfaithful, left for Ætolia to help his grandfather Œneus, and later settled in Daunia in Italy, where he married Euippe, daughter of King Daunus He was buried in one of the islands since called Diomedans, and his companions were turned into gentle birds. Philoctetes also settled in Italy.

348. Idomeneus, caught by tempest on his return to Crete, vowed to sacrifice to Poseidon the first person he met on return As this was his own son, Crete was punished by pestilence, and Idomeneus exiled. He settled in Calabria in Italy.

349. Demophon, son of Theseus visited Thrace and gained the love of the king's daughter, Phyllis, but when he left her to visit Athens, she killed herself in despair of his return and was turned into a tree.

350. Many sailors were ship-wrecked on the dangerous promontory of Caphareus, where Nauplius, King of Eubœa, eager to avenge the death of his son Palamedes, lighted misleading fires.

351. The seer, Calchas, like Amphilochus, went safely overland to Colophon. Here he contended in prophecy with Mopsus, a son of Apollo and Manto, the daughter of Teiresias, and being surpassed, he died of grief Amphilochus joined with Mopsus in founding the city of Mallus, but they killed each other in a fight for its possession.

352. Nestor alone returned home without mishap and enjoyed a happy old age.

THE WANDERINGS OF ODYSSEUS, 353–369.

353. Odysseus' journey home, lasting ten years, and his final arrival in Ithaca are the theme of Homer's epic the *Odyssey*. E. V. Rieu says that this may be thought of as a novel, and Samuel Butler argued that it might well have been written by a woman! The incidents of the *Odyssey* form the background of reference to the *Ulysses* of James Joyce

354. After leaving Troy, Odysseus and his men visited the Cicones, where he obtained several jars of sweet wine, and then they landed on the Libyan promontory of the Lotophagi Here lived the Lotus-eaters, who gave his men some of the fruit, inducing the enervating dreaminess described by Tennyson in *The Lotus-eaters*.

355. Next, landing on the west coast of Sicily, Odysseus, with twelve companions, entered the cave of a giant, but when the owner, the one-eyed Cyclops, Polyphemus, son of Poseidon, came in with his flocks, he blocked the entrance with a gigantic stone, and devoured two of Odysseus' companions Next evening, by which time only six of his men survived, Odysseus made Polyphemus drunk with his sweet wine and then blinded him At dawn the Greeks escaped by clinging under the bodies of the sheep as they went out to graze, and so reached their ship, but henceforth they had to reckon with the vengeful hostility of Poseidon

356. Odysseus was next entertained by Æolus, who gave him a bag of winds, but when his foolish crew untied this, they were blown back to Æolus, who now refused further help

357. In Telepylos, city of Lamus, king of the cannibal Læstrygones, Odysseus lost all his ships except one, but in this he reached Ææa, the island of the enchantress Circe, daughter of Helios and Perse Men sent by Odysseus to explore were turned by her to swine, and only Eurylochus returned to tell the news Odysseus, hastening to their rescue, was given, by Hermes, the plant Moly, which vanquished Circe's charms She restored his companions and lavishly entertained them all for a year.

358. Then, on Circe's advice, Odysseus sought the counsel of the dead seer Teiresias He sailed to the River Oceanus, and in the land of the Cimmerians summoned the spirits of the dead, who thronged to lap the blood of a libation he had prepared First appeared Elpenor, one of his crew, who while drunk had fallen to death from Circe's roof Later came Teiresias, who gave him prophetic advice, and then Anticleia, the mother of Odysseus, the men and women of antiquity, and his former comrades

359. He again visited Circe, who advised him how to circumvent the Sirens and Scylla and Charybdis Odysseus nullified the Sirens' spell by having himself lashed to the mast, and by filling the sailors' ears with wax, and he just avoided the whirlpool Charybdis, though Scylla's six mouths snatched and devoured as many of his seamen.

360. At the island of Thrinacia, against the warnings both of Teiresias and Circe, Odysseus' companions slaughtered the cattle of Helios, and when they put to sea Zeus destroyed all save Odysseus himself.

361. Clinging to wreckage, he drifted ten days until he reached the island of Ogygia Here the nymph Calypso lovingly kept him for eight years, until at Athene's request Zeus sent Hermes to command his release

362. On a raft that Calypso had taught him to make, Odysseus sailed for eighteen days, till it was wrecked by vengeful Poseidon Then helped by Leucothea and Athene, Odysseus landed on the island of Scheria. Here he was led by the beautiful Nausicaa to the Court of her father Alcinous, who was the prosperous ruler of the Phæacians. Alcinous gave Odysseus a ship, and after an absence of ten years he at last landed on Ithaca. Athene disguised him as a beggar and he was hospitably welcomed by his swineherd Eumæus.

363. Odysseus' mother Anticleia had died of grief, Lærtes his father had withdrawn to the country, and his wife Penelope had been keeping at bay a crowd of unruly suitors led by Antinous She had promised to wed one of them when she had finished a robe for Lærtes, but each night she unpicked the work of the day, until her servants betrayed her ruse, and she was now hard-pressed Her son Telemachus had gone in search of Odysseus, and after visiting Nestor and Menelaus, he now returned to Ithaca and also visited the hut of Eumæus.

364. Here Odysseus made himself known to Telemachus and they planned revenge. First the son set out for home, followed later by Odysseus still in beggar's disguise He was recognised only by his aged hound Argus, which at once expired, and by his nurse Eurycleia.

365. Next day Penelope announced that she would accept the suitor who could shoot with the great bow of Eurytus which only Odysseus had been able to wield No one could bend it till Odysseus seized it and shot Antinous. Supported by Telemachus, he killed the suitors, and at last made himself known to Penelope. He then visited Lærtes, but the kinsmen of the suitors rose against him and battle ensued until Athene, disguised as Mentor effected a reconciliation.

366. At this point the *Odyssey* ends, though Teiresias had prophesied that Odysseus must again set out on a journey and propitiate Poseidon and then return to an honourable old age till death came to him from the sea

367. Tennyson, in his poem *Ulysses*, imagines him, even in age, hungry still for travel

368. Another tradition says that Telegonus, son of Odysseus by Circe, while searching for his father, landed on Ithaca and began to plunder for food When opposed by Odysseus and Telemachus, all unknowing he killed his father He then took Telemachus and Penelope back to Ææa, and there married Penelope, while Telemachus married Circe.

369. Although Homer represents Penelope as a faithful wife, other writers say that she became the mother of Pan, either by Hermes or by all the suitors It is a tradition such as this that Joyce evidently follows in his *Ulysses*.

LEGENDS OF THE HOUSE OF PELOPS, 370–398.

370. Some of the most dramatic of all Greek stories have their setting in Mycenæ, city of the legendary hero Agamemnon In 1876 Schliemann began excavation on this ancient site, and here he unearthed the famous shaft-graves with their precious treasures, which probably date from 1600 B C, four centuries before the era of Agamemnon and the siege of Troy Schliemann thus proved to the learned world that the city at all events was historical, and scholars now believe that it was the centre of a Late Bronze Age culture.

371. According to legend, Agamemnon was a descendant of Tantalus, son of Zeus and the nymph Pluto and father of Pelops, Broteas, and Niobe Tantalus was said to be a wealthy king, but whether of Lydia, Argos or Corinth, is uncertain.

372. Highly favoured by his father Zeus, Tantalus was even invited to Olympian banquets, but he proved unworthy of such honours, divulging Zeus' secrets and stealing nectar and ambrosia from Olympus.

373. Tantalus was also said to have received from Pandareus a dog made of gold, and then to have sworn by Zeus that he had never seen or heard of it. As this dog was the one which Hephæstus had made for Rhea, and which she had set to watch the cradle of the infant Zeus, the gods were naturally incensed. Pandareus perished miserably, and his orphan daughters were carried off by Harpies, and Tantalus suffered agonising punishment for this and other crimes, the most ghastly of which was his murder of his son Pelops. Having invited the gods to a banquet, he cut Pelops into pieces and served them in a stew. Demeter, still grieving for Persephone, was the only divinity who did not notice what she was eating, and she consumed the shoulder.

374. Tantalus' punishment became proverbial. Tortured with thirst, he was placed in a lake whose waters receded whenever he attempted to drink, while above his head were laden fruit boughs which flew upwards as soon as he reached for them. Thus "tantalised," he also saw suspended above his head a huge rock which threatened to fall and crush him.

375. After punishing Tantalus, Zeus ordered Hermes to put the limbs of Pelops into a cauldron and boil them. Clotho took him from the cauldron, Demeter gave him an ivory shoulder, which became a kind of birthmark for his descendants, and Pelops was restored to life.

376. Pelops was later expelled from his kingdom of Phrygia and came with his followers to Pisa in Elis. Here Œnomaus, son of Ares, was king, and as an oracle had said that he would be killed by his son-in-law, he challenged to a chariot race all who came to woo his daughter, Hippodameia. If the young man won, he would marry Hippodameia, if not he would be killed by the spear of Œnomaus, which, like his wind-begotten horses, was a gift of his father Ares.

377. Many suitors had lost their lives when Pelops arrived in Pisa He was already possessed of a winged golden chariot, the gift of Poseidon, but he also bribed Œnomaus' charioteer Myrtilus, the son of Hermes, with the promise of half the kingdom, to remove the lynch-pin from the chariot of his master and substitute one of wax Œnomaus was flung out and killed, and Pelops married Hippodameia.

378. Pelops refused to keep faith with Myrtilus and flung him into the sea. Myrtilus, as he died, cursed the whole race of Pelops, and his image was set among the stars as the charioteer by his father Hermes. Pelops soon became master of Olympia and revived the Olympic Games His wealth and power in the peninsula were so great that it was called the Peloponnesus, or "Island of Pelops"

379. The eldest sons of Pelops, Atreus and Thyestes, with the connivance of their mother, killed Chrysippus, their half-brother, and were obliged to flee their home.

380. They were kindly received at Mycenæ, and after the death of King Eurystheus, Atreus seized the kingdom in spite of the bitter rivalry of Thyestes, whom he forthwith banished.

381. Thyestes, however, who had already succeeded in seducing Atreus' second wife Ærope, now tricked his brother into killing Pleisthenes, his own son by his first wife. Atreus, planning grisly reprisals, lured Thyestes to Mycenæ by promising him half the kingdom. He then killed the sons of Thyestes and served him their flesh at a banquet. When the horror-stricken father realised what he had eaten, he laid a curse on the house of Atreus and fled once more.

382. Thyestes, seeking revenge, was advised by the Delphic Oracle to beget a son by his own daughter, and going to King Threspotus at Sicyon, where his daughter Pelopia was a priestess, he ravished her and fled.

383. Atreus now visited Sicyon, and, believing Pelopia to be a daughter of Threspotus, married her as his third wife. When she gave birth to Thyestes' son, Ægisthus, she exposed the baby, but Atreus, believing Ægisthus to be his own child, took him in and reared him.

384. When later Thyestes was seized and brought back to Mycenæ, Atreus commanded Ægisthus to slay him, but Thyestes disarmed the boy, and recognising him as his own son, ordered him to kill Atreus. Then, at last, Thyestes ruled in Mycenæ.

385. According to Homer, Atreus had two sons by Ærope, Agamemnon and Menelaus, and these two now took refuge with King Tyndareus of Sparta Here Menelaus married Helen, daughter by Zeus of Tyndareus' wife, Leda, and some say that Agamemnon was helped by Tyndareus to expel Thyestes and gain his father's throne

386. Agamemnon's wife was Clytemnestra (the daughter of Tyndareus and Leda), whom he forcibly married after killing her first husband in battle But when his brother's wife, Helen, was stolen away by Paris, and the Trojan War broke out, Agamemnon was away fighting for ten years, and it was not difficult then for Ægisthus to seduce Clytemnestra.

387. Not only had Agamemnon forcibly married Clytemnestra, but he had also agreed to the sacrifice of their daughter, Iphigeneia at Aulis, and her cup of bitterness was full when she learned that he was returning from Troy, bringing with him Priam's daughter, the prophetess Cassandra, as his mistress

388. It is at this point that Æschylus' great trilogy of the *Oresteia* begins. Clytemnestra conspired with Ægisthus to kill both Agamemnon and Cassandra She welcomed her husband royally on his return, but while he was in his bath entangled him in a net, and after Ægisthus had twice struck him, she beheaded him with an axe She then went out to kill Cassandra, who had refused to enter the palace because, in visionary trance, she was horrified to smell the ancient shedding of blood and the curse of Thyestes (*see para* 381).

389. It was not difficult now for Clytemnestra to seize power, for Orestes, her young son, had been smuggled out of Mycenæ by his sister Electra, and for many years Clytemnestra and her paramour ruled in Mycenæ.

390. Ægisthus, however, lived in constant fear of vengeance He would have killed Electra had Clytemnestra allowed, so he married her to a peasant, who was fearful of consummating their union Orestes meanwhile had taken refuge with Strophius, King of Phocis, who had married Agamemnon's sister, and here he formed that friendship with the king's son, Pylades, which became proverbial.

391. The intensely dramatic situation at this point has inspired all three of the great Greek tragedians, and it is most interesting to compare the various interpretations given by Æschylus, in *The Libation Bearers*, the second play of his trilogy, by Sophocles, in *Electra*, and by Euripides, in *Electra*.

392. Electra, burning for revenge, sent constant messages to Orestes, and when he and Pylades were of age they came secretly to Mycenæ, and with Electra's help killed both Ægisthus and Clytemnestra.

393. The agonising punishment that Orestes now endured is portrayed in the *Eumenides*, the last play of Æschylus' trilogy, and in the *Orestes* of Euripides. Although the Delphic Oracle had encouraged Orestes to avenge his father, she was powerless to prevent his being pursued by the Erinnyes, the avengers of matricide, who drove him mad and hounded him from land to land. At length, on the further advice of the Pythian Priestess, he reached Athens and embraced the image of Athene in her temple on the Acropolis. The goddess then summoned the Areopagus to

judge his case. Apollo defended him against the Erinnyes on the grounds that motherhood is less important than fatherhood, and he was acquitted by the casting vote of Athene, the verdict being a triumph for the patriarchal principle

394. The furious Erinnyes were then pacified by Athene, who persuaded them to accept a grotto in Athens, where they would be offered sacrifices, libations, and first fruits Their name henceforward was Eumenides, or the "well-meaning"

395. According to another tradition, followed by Euripides, in his *Iphigeneia Among the Taurians*, Orestes was told by Apollo that he would be freed from madness by fetching the statue of Artemis from the Tauric Chersonese

396. When Orestes and Pylades reached Tauris they were seized by the barbarous natives, who sacrificed all strangers to Artemis, but they found to their amazement that the priestess was none other than Orestes' own sister Iphigeneia. Orestes believed that she had lost her life when sacrificed to Artemis at Aulis (as is described in para 300), but she had in fact been rescued by the goddess and brought to Tauris as her priestess.

397. Iphigeneia, by her ready wit, rescued Orestes and Pylades from sacrifice, and all three returned to Greece, carrying with them the image of the goddess Here they were reunited with Electra, and returned to Mycenæ, where Orestes, by killing Ægisthus' son and becoming king, finally ended the strife between the sons of Atreus.

398. Orestes, after killing his rival Neoptolemus, married his cousin Hermione, and Electra was married to Pylades.

THE UNDERWORLD, 399-409.

399. The Greeks expected to enter after death into the cheerless nether world, the domain of Hades, known to the Romans as Orcus, or Dis, but as Hades was possessor of all the rich metals and gems of the earth, the ancients usually preferred the euphemism "Pluto," "the wealth," when speaking of one so dreaded.

400. The word "Hades" was used too of his actual domain, which was also called Tartarus, although in the *Iliad*, the word "Tartarus" had been reserved for the very lowest region of the Underworld, where the rebel Titans had been thrust

401. Hades, son of Cronus and Rhea, won the lordship of the nether world when his brother Zeus won the sky, and Poseidon the sea His most treasured possessions were the helmet of darkness, given him by the Cyclopes, and the staff with which he drove the ghosts.

402. He ruled with his queen, Persephone, whom he had forcibly abducted from the upper world, but he was not always faithful to her, and she once changed the nymph Minthe, whom he was pursuing into the plant mint, and the nymph Leuce, whom he loved, was afterwards changed into the white poplar.

403. The companion to Persephone was Hecate, who had once aided Demeter in her search for the lost maiden Hecate was a mysterious divinity, a triple goddess, mighty in heaven, on earth, and in the Underworld, honoured by Zeus and all the immortal gods She came to be regarded by the Hellenes as primarily a dread divinity of the Underworld, as one who kept company with the dead and who fostered sorcery and witchcraft She figures as such in *Macbeth* Worshipped where three roads met, she was represented with three bodies and three heads.

404. Also dwelling in the Underworld were the Erinnyes, winged daughters of earth or of night, with serpent hair, who punished unnatural crime. They were later known euphemistically, as the "Eumenides," or "well-meaning," and this name was said to have been given them after the acquittal of Orestes, as is portrayed in the *Eumenides* of Æschylus Late writers named three Erinnyes, Alecto, Megæra, and Tisiphone

405. Ghosts conducted to Hades' realm by Hermes had first to cross the Styx, the "hated" river, and supplied by relatives with a coin laid under the tongue of the corpse, they paid the surly ferryman Charon Without this coin they were unable to cross the Styx Arrived on the farther bank, they propitiated Cerberus, represented by later writers as a fierce dog with three heads, said to be another of the monsters born to Echidne

406. Styx was not the only river ghosts encountered There was also Acheron, river of woe, Phlegethon, river of flames, Cocytus, river of wailing, and Lethe, the river of forgetfulness, where ghosts drank and forgot their past.

407. The three judges of the Underworld were Æacus, Rhadamanthus, and Minos Wicked spirits were sent by them to the place of punishment, those who had led an indifferent life to the cheerless asphodel fields, and the virtuous to Elysium

408. Although Elysium was said to be near the Underworld, it formed no part of Hades' dominion, and Homer placed it far away to the west of the earth, near Oceanus It was a blessed abode, without cold or snow. Later writers also spoke of the "Fortunate Isles," located by Greek geographers as beyond the pillars of Heracles, and eventually identified with the Canary and Madeira islands

409. In their picture of life after death the Greeks combined contradictory ideas. Broadly speaking, the figures of Persephone and Hecate represent the hopes of pre-Hellenic people for an after-life, while Hades personifies the Hellenic fear of the finality of death

PART III. INDEX AND GLOSSARY

Note The numbers in this part refer to the numbered paragraphs in Part II.

Apollo, 10, 14, 26, 32, 36, 68–80, 82–85, 92, 94, 104, 183, 251, 277 283, 298, 309, 321, 330, 331, 351, 393, 395.

Apple of Discord, 280

Arachne, a Lydian maiden who challenged Athene to compete with her in weaving When Athene found Arachne's work faultless, she angrily tore it up, and the terrified maiden hanged herself. Athene then turned her into a spider and the rope into a cobweb

Arcadia, 85, 92, 97

Arcas, son of Zeus and Callisto, who was supposed to have given his name to Arcadia

Arctos, *see* **Callisto.**

Areopagus, 43, 67, 105.

Ares, *see especially* 64 67 *and also* 10, 13, 14, 25, 33, 55, 60, 61, 154, 158, 178, 213, 317, 376.

Arethusa, 88.

Arges, 1.

Argia, 261.

Argo, The, 155–160, 162

Argonauts, 154–160

Argos, 30, 33, 34, 45, 125, 130, 142, 143

Argus. (1) The hound of Odysseus, 364.
(2) The hundred-eyed, 95
(3) The builder of Argo, 155

Aria, the mother of Miletus by Apollo

Ariadne, 231, 235.

Arion (1) An actual historical character was a lyric poet and player on the lyre, who lived at the Court of Periander of Corinth at about 625 B.C. The following curious fable is told of him, On one occasion Arion visited Sicily and won the prize in a musical contest Laden with gifts, he took ship for Corinth, and the captain and crew decided to murder him for his treasure. They gave him permission to sing one last song. Arion then invoked the gods, and leapt into the sea Here he was rescued by one of the music-loving dolphins that had gathered to hear his song, and taken on its back to Corinth, where he told Periander of his adventures Later, when the ship arrived, the captain and crew swore that Arion had been detained in Sicily Periander then confronted them with Arion himself and had them executed The images of Arion and his lyre were set among the stars
(2) A fabulous horse, 103

Aristæus was the son of Apollo and Cyrene, born in Libya He went to Thrace and fell in love with Eurydice, who, fleeing from him, perished by a snake bite As a punishment Aristæus lost his bees, and how he raised a new swarm is told in Virgil's fourth *Georgics* After death was worshipped as a god

Arsinoe, 271

Artemis, 10, 13, 14, 26, 69, 70, 72, 81–89, 251, 229, 300

Ascalaphus, 112, 184.

Asclepius or **Æsculapius** was a son of Apollo by Coronis He was brought up by Cheiron, who taught him healing He once recalled a dead man to life and was killed by Zeus with a thunderbolt. At Apollo's request, however, he was placed among the stars Another tradition says that Asclepius was a native of Epidaurus In Homer he was not a god, but the "blameless physician," father of Machaon and Podalirius, physicians to the Greek Army. His supposed descendants were the Asclepiadæ, a caste of priests who transmitted from father to son the knowledge of medicine as a sacred secret. Epidaurus was the centre of Asclepius' worship. Cocks were sacrificed to him and serpents sacred

Asopus, a river god, son of Oceanus and Tethys, and father of Evadne, Eubœa, and Ægina

Astarte, 57.

Astræus, a Titan, was father, by Eos, of the beneficent winds and, some say, of the stars also

Astyanax, 336.

Atalanta. (1) The Arcadian Atalanta, daughter of Iasus and Clymene, was exposed by her father and suckled by a bear. She always carried arms. She joined the Calydonian hunt and bore a son, Parthenopæus, to Meleager. Reconciled to her father, she refused to marry unless a suitor should conquer her in a foot race, those who failed in the attempt being killed by her. Eventually Milanion outstripped Atalanta by dropping in her way one after the other, three golden apples given him by Aphrodite. Atalanta stopped to gather these and lost the race *See also* 263.
(2) The Bœotian Atalanta was said to be daughter of Schœneus and to have married Hippomenes, but the same tales are told of her. See Swinburne's play *Atalanta in Calydon* and the poem *Atalanta's Race*, by William Morris.

Athamas, was the son of Æolus and King of Orchomenus in Bœotia At Hera's command he married Nephele, and had children Phrixus and Helle But Athamas secretly loved Ino, daughter of Cadmus and Harmonia, who bore him Learchus and Melicertes Deceived by Ino's intrigues, Athamas would have sacrificed Phrixus, had not a ram with a golden fleece, sent by Hermes, rescued the boy and flown through the air with him and his sister Helle. Between Europe and Asia, Helle fell into the straits since called Hellespont, but Phrixus reached Colchis, where he sacrificed the ram to Zeus and gave the fleece to Æëtes, from whom it was later carried off by Jason Meanwhile Athamas, driven mad by Hera because he had sheltered Dionysus, killed his son Learchus, and Ino flung herself into the sea with Melicertes, where both were transformed into marine deities Ino became Leucothea, and Melicertes changed to Palæmon Athamas, forced to flee, settled in Thessaly *See also* 120

Athene, *see especially* 38–45 *and also* 14, 15, 48, 66, 77, 102, 105, 134, 135, 141, 148, 155, 178, 184, 189, 243, 244, 265, 280, 281, 325, 328, 330, 335, 345, 361, 362, 393, 394

Athens, 42, 48, 86, 97, 102, 105, 112, 114, 117, 118, 128.

Atlantiades, 91

Atlantis was a legendary island, west of the Pillars of Hercules Its virtuous and powerful inhabitants, becoming degenerate, were defeated by the Athenians, and the island was swallowed up by the ocean in a day and night *See* the *Timæus* of Plato

Atlas, the son of Iapetus and Clymene, was father of the Pleiades, Hyades, and Hesperides. *See also* 7, 9, 16, 91, 138, 183

Atlas, Mt, 136, 183

Atreus, 379, 380, 381, 383, 384, 385, 397.

Atropos, one of the Fates

Auge, 191

Augeias, stables of, 177, 190.

Aulis, 299, 300, 318, 387

Autolycus, 96, 167, 290, 329.

Autonoœ, 214, 216.

Bacchæ, 117, 123 Also called Bacchantes, Mænads, or Thyiads

"Bacchæ, The," 123, 246

Bacchoi, 117

Bacchus, a name for Dionysus, 117–128.

Bassareus was an epithet of Dionysus "Bassaris" was a fox-skin which was worn by the god and also the Mænads in Thrace. Hence Bassaris means Mænad or Bacchante

Bathos, 12

Baucis, *see* **Philemon.**

Bebrycos, 157

Bellerophon, 145–150.

Bellerus, 146

Belus, son of Poseidon and father of Ægyptus, Danaus, and Cepheus

Bias, brother of Melampus.

Biton and Cleobis, sons of a priestess of Hera at Argos, in their filial devotion once dragged their mother's chariot to the temple Their mother prayed Hera to grant them the best gift for mortals, and they both died while asleep in the temple

Bœotia, 117, 120, 123.

Boreas, the North wind, was the son of Astræus and Eos, and brother to the other beneficent

Chimæra, 147; Nemean Lion, 173; Lernean Hydra, 174; Orthrus, 182; Ladon, 183; Sphinx, 255, Cerberus, 184, 405. Her mate was Typhon. She was killed by Argus.

Echion. (1) Son of Hermes, took part in the Calydonian hunt and was herald to the Argonauts
(2) One of the Sparti, 243, 246

Echo was a nymph who diverted Hera's attention with incessant talking while Zeus amused himself with the nymphs When Hera discovered the trick she took from Echo all use of her voice except in repetition of another's speech Echo then fell in love with Narcissus, a beautiful youth, who repulsed her, and she pined away in grief until only her voice remained Artemis, in anger at Narcissus' coldness, caused him to fall in love with his own reflection in a fountain. In despair he took his own life and was turned into the flower.

Edones, 122.

Eetion, 306.

Elatus, one of the Lapithæ, and father of Cæneus.

Electra. (1) The Pleiad, 274
(2) Daughter of Agamemnon and Clytemnestra, 389, 390, 392, 397, 398

"Electra" of Euripides, 391

"Electra" of Sophocles, 391

Electryon, King of Mycenæ, was the son of Perseus and Andromeda His daughter Alcmene married Amphitryon

Eleusis, in Attica, had a splendid temple of Demeter, 112, 113, 114

Elpenor, 358.

Elysium, 407, 408.

Empusæ, daughters of Hecate, were horrible demons, with the haunches of asses and wearing brazen slippers They could disguise themselves as bitches, cows, or maidens, and in the latter shape they would lie with men asleep and suck their strength till they died. The idea of Empusæ was probably brought from Palestine, where the Lilim, or daughters of Lilith, had similar characteristics

Enceladus, 11, 12

Endymion, King of Elis, was a beautiful Æolian youth, who, while sleeping in a cave on Carian Mt Latmus, was seen by Selene the moon, who came down and kissed him He afterwards returned to the cave and fell into a dreamless sleep By his wife he had four sons, one of them being Ætolus, who conquered the land now called Ætolia The myth probably indicates the fate of one who marries the moon Goddess See Keats's *Endymion*

Enipeus was the river god loved by Tyro

Enna, 112.

Eos, in Latin Aurora, was the Dawn, daughter of Hyperion and Theia She drove her chariot each morning to announce the approach of her brother Helios, and, as Hemera, accompanied his across the sky to arrive with him in the West in the evening as Hespera Her husband was Astræus, said by some to be father by her of the stars and all winds save the East Eos carried off several beautiful youths, including Orion, Cephalus, and Tithonus Her son by Tithonus was Memnon Eos asked Zeus to grant Tithonus immortality, but omitted to ask also for perpetual youth. Tithonus therefore shrank away until he became a cicada Among Greeks in Asia Minor the golden cicada was an emblem of Apollo the sun god

Epaphus, son of Zeus and Io, reigned over Egypt, and was rumoured to be the sacred bull, Apis.

Ephesia (Artemis Ephesia), 81.

Ephesus, 87, 88.

Ephialtes, 11, 13.

Epigoni, 268, 269.

Epimetheus, 16, 17, 20.

Erato, the Muse of erotic poetry and mime, sometimes carries a lyre

Erebus, or darkness, son of Chaos, begot Æther and Hemera by his sister Night. *See also* 25.

Erichthonius. (1) Son of Hephæstus. Athene entrusted to the daughters of King Cecrops of Athens a chest which they were forbidden to open. It concealed the infant Erichthonius. According to one version, the daughters (Agraulos, Pandrosos, and Herse) were overcome with curiosity and opened the chest Seeing a serpent within it, they leapt in madness from the Acropolis to their death. Erichthonius succeeded Cecrops as King of Athens, and was himself succeeded by Pandion.
(2) Erechtheus the second was grandson of Erechtheus, son of Hephæstus, and the son of Pandion, whom he succeeded as King of Athens He was father by Praxithea of four sons, including Cecrops, and seven daughters, Protogonia, Pandora, Procris wife of Cephalus, Creusa, Oreithyia, Chthonia, and Otionia. When the Eleusinians under Eumolpus son of Poseidon attacked Athens, Erechtheus was told to sacrifice Otionia, whereupon her two eldest sisters, Protogonia and Pandora, also sacrificed themselves Erechtheus slew Eumolpus, whereupon Poseidon demanded vengeance, and either he or Zeus slew Erechtheus.

Eridanus was a river god Phæthon fell to his death here Because amber was found here Eridanus was later supposed to be the Po

Idæa, 271

Idas, the twin brother of Lynceus, was said to be son of Aphareus He was in love with Marpessa, whom he carried off in a chariot given him by Poseidon, who was really his father. Idas' rival Apollo fought with him for Marpessa, but Zeus separated the combatants, and she chose Idas. With his devoted twin he took part in the Calydonian hunt, and the Argonauts' expedition, and both were finally killed in a battle with their rivals, the Dioscuri.

Idomeneus, 297, 318.

"Iliad," 77, 101, 309, 313, 316, 400.

Ilithyiæ, daughters of Hera, who in the *Iliad* and early poets are represented as helping women in childbirth In the *Odyssey* and later poets only one goddess, Ilithyia, is represented. *See also* 33.

Illyrius, son of Cadmus, 244.

Ilus, 274.

Imbros, 56

Inachus, son of Oceanus and Tethys, was first King of Argos, and gave his name to the river.

Ino, 120, 244, 246.

Io, daughter of Inachus was beloved by Zeus, who turned her into a white heifer through fear of Hera. The goddess Hera set Argus of the hundred eyes to watch the heifer, but Hermes, at Zeus' bidding, charmed Argus to sleep and cut off his head. Hera placed Argus' eyes in the tail of her favourite bird, the peacock, and sent a gadfly to torment Io, who fled from land to land till she came to the Nile Here she recovered her human form and bore Zeus a son Epaphus. The Ionian Sea and the Bosphorus, (or cow's ford) were said to have derived their name from Io.

Laomedan, 274, 275.

Lapithæ were a mythical people living in Thessaly and governed by Pirithous, who, being a son of Ixion, was half-brother to the Centaurs Rivalry between the Centaurs and Lapithæ reached its climax at the celebrated struggle at the wedding of Pirithous. *See also* 212.

Larissa, 142.

Leander, a youth of Abydos, swam across the Hellespont every night to visit Hero, priestess of Aphrodite in Sestos. One night he was drowned, and Hero then flung herself into the

sea. Marlowe tells the story in his poem *Hero and Leander*.

Leda was the daughter of Thestius and the wife of Tyndareus, King of Sparta. Her children were Helen, Polydeuces, Castor, and Clytemnestra. According to the usual tradition, Zeus visited Leda in the form of a swan, and she laid an egg, from which were hatched Helen, Polydeuces, and Castor, while Clytemnestra was the daughter of Tyndareus. Others say that only Helen and Polydeuces were Zeus' offspring; others, including Homer, that Helen alone was child to Zeus. The rape of Leda is the subject of Yeats's fine poem, *Leda and the Swan*.

Lemnos, 47, 52, 56, 156, 301, 323.

Lerna, Hydra of, 174, 196.

Leto, called Latona, was the daughter of the Titans, Cœus and Phœbe, and mother by Zeus of Apollo and Artemis. *See also* 26, 70, 72, 251.

Leuce, 402.

Leucippus, son of Œnomaus, was in love with Daphne, and disguised as a woman joined her nymphs. When Apollo advised them to bathe naked, his disguise was discovered and the nymphs tore him to pieces.

Leucothea, a sea-goddess, formerly Ino, beloved by Athamas, 362.

"Libation Bearers," 391.

Lichas, 196.

Linus. (1) According to the Argive story, Linus was the son of the princess Psamathe by Apollo. Psamathe exposed her son, who was reared by shepherds, but later torn to pieces by her father's dogs. Her distress at this revealed her predicament to her father, who condemned her to death. Apollo, in anger, visited Argos with a plague, until the Argives propitiated Linus and Psamathe by dirges called "linoi."

(2) Another tradition told of a Linus, son of a Muse, who was gifted in music and killed by jealous Apollo.

(3) The Thebans also told of Linus the instructor of Heracles, who was killed by the hero with a lyre. *See also* 167.

The ancient "linoi" dirges were widespread, and they have been described by Frazer in *The Golden Bough*. They are most probably lamentations for Linus as a vegetation spirit, perhaps of flax.

Medus, son of Ægeus and Medea, 206.

Medusa, 40, 108, 133, 134, 135, 137, 138, 141, 148.

Megæra, one of the Eumenides, 3, 404.

Megapenthes, 143.

Megara or **Megera**, 170, 185.

Melampus, son of Amythaon, was the prophet and seer who first introduced into Greece the worship of Dionysus. Having cured the three daughters of Prœtus and other Argive women of madness, he and his brother Bias received from Prœtus two-thirds of the kingdom.

Melanippe was the child of Æolus, son of Hellen, and Euippe.

Melanippus, 265.

Meleager was the son of Œneus and Althæa. When he was seven days old the Fates declared he would die when a certain brand on the hearth should be consumed, but Althæa quickly extinguished the brand and hid it. Meleager accompanied the Argonauts and successfully led the heroes against the Calydonian Boar. When he gave the hide to Atalanta, Althæa's brothers took it from her, and Meleager slew them. Althæa then flung the fateful branch into the fire and Meleager expired. Althæa now killed herself, and her daughters (excepting Gorge and Deianeira) were turned by Artemis into guinea-hens. *See also* 263.

Melicertes, son of Athamas and Ino.

Melpomene, the Muse of Tragedy.

Memnon, 318, 319, 320.

Memnonia, 321.

Memnonides, 319.

Menelaus, 284, 286, 287, 289, 291, 302, 310, 314, 334, 345, 363, 385.

Menestheus, 216.

Menœceus. (1) Father of Jocasta, 258.

(2) Son of Creon, 264.

Mentor, Odysseus' faithful friend, 365.

Mercurius, 90.

Meriones, 297.

Merope, one of the Pleiades, and wife of Sisyphus.

Metaneira, wife of Celeus of Eleusis, and mother of Abas, Demophon, and Triptolemus.

Metis, 7, 25, 41.

Midas was the son, or adopted son, of Gordius, King of Phrygia. He kindly entertained Silenus, and when Dionysus asked him what reward he would like, Midas requested that all he touched should be turned to gold. When he was unable to eat, Midas begged to be freed of his golden touch and was told by the god to bathe in the source of the Pactolus, near Mt. Tmolus. The sands of this river then became rich with gold.

Once when Apollo engaged in a musical contest with Pan, Midas declared in favour of Pan and was cursed by revengeful Apollo with a pair of ass's ears. These he hid under a Phrygian cap so that only his barber knew of the disgrace, until the barber, unable any longer to keep the secret, whispered it to a hole in the ground. Then a reed growing in that spot whispered the secret abroad.

Milanion, husband of Atalanta.

Miletus, 74, 225.

to the Underworld. Here his music delighted even Hades, so that he allowed Eurydice to follow her husband back to life, provided only that he did not look round On the very threshold of life Orpheus anxiously looked back, and so lost Eurydice He was so desolate with grief that the jealous Thracian women tore him to pieces in an orgy of Dionysus, a god whom he had neglected to honour The Muses collected the fragments of his body, which were buried at the foot of Olympus, but his head, thrown into the River Hebrus, was carried still singing down to sea and on to Lesbos, whither his lyre also drifted, to be placed later as a constellation in the heavens at the intercession of Apollo and the Muses

The Greeks considered Orpheus to be the greatest poet before Homer, and fragments of poetry extant were ascribed to him

The religion "Orphism" was characterised by a sense of sin and the need for atonement, the idea of a suffering man-god, and a belief in immortality. It had an influence on such philosophers as Pythagoras and Plato, and formed a link between the worship of Dionysus and Christianity.

Orthrus, 182, 255

Ortygia, 70.

Ossa, 13

Otrere, 317

Otus, 13

Ovid, 112, 161

Palæmon, a sea-god, originally Melicertes, son of Athamas and Ino

Palamedes, son of Nauplius, 288, 289, 291, 302, 350

Palladium, 325, 327, 330, 311

Pallas. (1) a giant, 11
(2) a father of fifty sons, 206
(3) a name for Athene, 39, 40

Pan, the misshapen god with goat feet, horns, and tail, was said by some to be an ancient divinity coæval with Zeus, though most reported him to be the son of Hermes He was the god of shepherds and flocks, living in rural Arcadia, hunting and dancing with the nymphs He would also lurk in forests, startling travellers with a sudden shout and filling them with "panic" Pan loved many nymphs, including Syrinx, who fled in terror and was metamorphosed into a reed, from which Pan made the syrinx (or Pan's pipe) that he was said to have invented, for his love of music was well known He was also said to have seduced Selene The Olympians looked down on Pan as a rustic, uncontrolled divinity He is the only god whose death was reported The worship of Pan began in Arcadia, which was despised by the Greeks for its backwardness It did not reach Athens till early in the fifth century B C. The Romans later identified Pan with Faunus. *See also* 14, 77–97, 369

Panathenaic, 44, 118, 233.

Pandareus, 373.

Pandion, King of Athens, was son of Erichthonius and father of Procne, and Philomela, and of Erechtheus, who succeeded him.

Pandora, 17.

Pandrosos, daughter of Cecrops To her and her sisters, Erichthonius was entrusted.

Panopeus, 328.

Panthous, 314.

Paphos, 58, 59.

Parcæ, *see* **Fates**.

Paris, 35, 277–282, 284, 287, 310, 321, 324

Parnassus, Mt., a lofty mountain range north-west of the Gulf of Corinth. The name was usually limited to the two-peaked summit north of Delphi, above which the Castalian spring issued The mountain was one of the chief seats of Apollo and the Muses, and was also sacred to Dionysus. *See also* 20, 69, 7

Parthenon, 44, 48, 118.

Partheno Pæus, 263, 265.

Parthenos, a name of Athene, 39.

Pasiphæ, 231, 234, 238.

Patroclus, 296, 314, 316

Pegasus, 108, 137, 148, 150.

Pelasgians, 47

Peleus, son of Æacus, King of Ægina, joined with his brother Telamon in killing their half-brother Phocus Expelled by Æacus, he went to Phthia in Thessaly, where he was purified by the king's son Eurytion, but accompanying Eurytion to hunt the Calydonian Boar, he accidentally killed his benefactor Peleus now fled to Acastus, King of Iolcos, who purified him, but here he was falsely accused by Acastus' wife Acastus then took Peleus on a hunting expedition on Mt Pelion, and while his guest was asleep secreted his sword and deserted him Peleus would have been killed by Centaurs had not Cheiron rescued him Zeus now decided to give to Peleus the Nereid Thetis as wife. Zeus himself would have married her had he not been warned by Themis that she would bear a son more illustrious then his father Cheiron told Peleus how to master Thetis by holding her fast whatever form she might assume, and all the divinities save Eris came to the wedding She in revenge cast in the golden apple, which caused, eventually, the Trojan War. Thetis bore to Peleus the hero Achilles, whose death he survived *See also* 280, 293, 296.

Pelias, 108, 152, 153, 154, 161.

Pelides, the son of Peleus, that is Achilles.

Pelion, Mt., 13

Pelopia, 382, 383

Peloponnesus, 58, 378

Pelops, 251, 325, 326, 371, 373, 375, 376, 377, 378, 379

Pelorus, one of Sparti, 243.

Penelope, 290, 363, 365, 368, 369

Peneus, a god of the River Peneus in Thessaly, son of Oceanus and Tethys and father of Daphne and Cyrene

Penthesilea, 317.

Pentheus, 123, 246

Perdix, nephew of Dædalus, 237

Periclymenus, the Argonaut was the son of Neleus and brother of Nestor Though he could assume what shape he chose, he was killed by Heracles

Periphetes, a monster at Epidaurus who used to kill passers-by with an iron club He was killed by Theseus

Pero, daughter of Neleus and Chloris and wife of Bias

Perse, daughter of Oceanus and wife of Helios, by whom she became the mother of Æëtes, Circe, Pasiphaë, and Perses

Persephone, 25, 103, 106, 111–115, 214, 373, 402, 403, 409

Perses, son of Helios and Persë and father of Hecate.

Perseus, 129–144, 166

Pesistratus, 44, 114, 118

Petasus, 98

Phæacians, 362.

Phædra, 211

Phæthon, "the shining," was a son of Helios by Clymene. He gained his father's permission to drive the chariot of the sun, but his incompetence provoked Zeus to kill him with a thunderbolt, and he fell into the River Po. His mourning sisters were turned into alder- or poplar-trees, which wept tears of amber Phæthon's fate may represent the ritual death of the boy interrex for the sacred king, who ruled for one day and was then killed, usually by horses.

During the Bronze Age amber, sacred to the king, was carried from Baltic to Mediterranean via the Po valley.

Phalanthus, a mythical Spartan said to have founded Tarentum in Italy about 700 B C

Phasis, river, 157.

Pheræ was an ancient town in Thessaly, the home of Admetus.

Pheres, son of Cretheus and Tyro, was the father of Admetus and Lycurgus and the founder of Pheræ in Thessaly.

Philemon, an old man of Phrygia who, with his wife Baucis, hospitably received Zeus and Hermes

Phineus was the son of Agenor and ruled in Salmydessus in Thrace He imprisoned his sons, by his first wife, Cleopatra, because of a false accusation made by their stepmother, Idæa. For this, or some other fault, he was punished with blindness, and two Harpies tormented him When the Argonauts reached Thrace, Zetes and Calais, brothers of Cleopatra, killed the Harpies and were also said to have vindicated and freed their nephews, the sons of Phineus In return, he advised Jason what course to take (*see* 157) Milton compares himself to Phineus (*Paradise Lost*, Book III, lines 35, 36)

Phocis, a country in Northern Greece, its chief mountain Parnassus and its chief river Cephissus, 390

Phocus, son of Æacus, killed by his half-brothers Telamon and Peleus

Phœbe, a name of Artemis as goddess of the moon.

Phorcys, a sea-deity, was, by Ceto, the father of Ladon, Echidne, the three Gorgons, and the three Greæ.

Phoroneus, son of Inachus and the nymph Melia, was an early mythical King of Argos.

Phrixus, son of Athamas and Nephele.

Pieria, on the south-east coast of Macedonia, was inhabited by Thracian people, who in early times worshipped the Muses, hence called Pierides *See also* 92

Pierides. (1) The Muses
(2) The nine daughters of Pierus, a king in Macedonia, named after the Muses They were conquered in a contest with the Muses and turned into birds

Pirithous, the son of Ixion and Dia, was King of the Lapithæ in Thessaly He became a close friend of Theseus *See also* 212, 213, 214

Pittheus, King of Troezen, was son to Pelops and father of Æthra, 203

Pleiades, daughters of Atlas and Pleione were companions of Artemis They were changed into doves and placed among the stars

Polymnia or **Polyhymnia**, the Muse of the sublime hymn

Priapus, son of Dionysus and Aphrodite, a god of fruitfulness

Procris was the daughter of the second Erectheus to be King of Athens She married Cephalus *See also* 229

Procrustes or the "Stretcher" was the surname given to the robber Polypemon He used to tie travellers to a bed, and if they were too short he would rack them, and if too tall, he would hack off their legs He was served in the same way by Theseus *See also* 205

Prœtus, son of Abas, King of Argolis, inherited the kingdom jointly with his twin brother Acrisius Soon expelled, he fled to Iobates, King of Lydia, whose daughter Anteia, also called Stheneboea, he married Returning to Argolis, he forced his brother to divide the kingdom and became ruler of Tiryns, whose massive walls he built by aid of the Cyclopes *See also* **Melampus, Bellerophon.**

Proteus was the prophetic old man of the sea, subject to Poseidon, whose flocks of seals he tended By assuming any shape he chose, he could avoid the need of prophesying, unless gripped fast, when he would at last resume his usual shape and tell the truth. He could be found at midday in the island of Pharos *See also* 183, 345

Psyche appears in late Greek literature as a personification of the soul, purified by suffering to enjoy true love. The beauty of the maiden Psyche excited the envy of Aphrodite who sent Eros to persecute her, but he fell in love with her and secretly visited her nightly. When Psyche, urged by her two sisters, sought to discover his identity, he left her Searching for Eros, she endured further persecution, but he secretly helped her, and she finally overcame Aphrodite's hatred, to become immortal and united with Eros for ever The story is told in *The Golden Ass* of Apuleius

Pygmalion of Cyprus is said to have fallen in love with the ivory image of a maiden that he himself had made, and to have prayed Aphrodite to breathe life into it When she consented, Pygmalion married the maiden, whom he called Galatea By her he became the father of Paphus and Metharme. It is probable that the story concerns a priest of Aphrodite at Paphus who kept the image of the goddess in order to retain power See William Morris's version in *The Earthly Paradise*

Rhadamanthus, 224, 225, 226, 407.

Rhea, 1, 5, 6, 7, 30, 101, 111, 122, 373.

Rhesus, 313.

"**Rhesus**," attributed to Euripides, 313.

Rhode or **Rhodos** was said to be the daughter of Poseidon. She was the wife of Helios.

Salmoneus, son of Æolus and brother of Sisyphus, emigrated from Thessaly and built Salmone. In his presumption he emulated Zeus, who destroyed him and his city with a thunderbolt.

Samos, 30, 34.

Sarpedon, 224, 225, 307, 311, 314.

Saturnus, a mythical King of Italy, identified by the Romans with Cronus.

Satyrs were beings who embodied the fertile power of nature. They were represented as men wearing skins and crowned with vine, fir, or ivy, with pointed ears, small horns, and a tail. They were said to be sons of Hermes, and were always connected with the worship of Dionysus. Older Satyrs were called Sileni. *See also* 121, 127.

Scæan Gate, 321.

Scamander, River, 274, 313, 317.

Scheria, 362.

Sciron was a robber living on the frontier between Megaris and Attica. He robbed travellers and compelled them to wash his feet on the Scironian rock. He then kicked them into the sea, where a giant tortoise turtle devoured them. He was killed by Theseus. *See also* 205.

Scylla and **Charybdis** were two rocks between Italy and Sicily. In one dwelt Scylla, a fearful monster with six barking heads and twelve feet. Under the opposite rock lived Charybdis, who thrice daily swallowed and then regurgitated the waters of the sea. See *Odyssey* XI, ll. 85-110, *and also* 108, 359.

Scylla, daughter of Nisus, 230.

Scyros, 295, 326.

Selene, 84, 89.

Semele, 26, 119, 126, 241.

Semiramis and her husband Ninus were mythical founders of Ninus or Nineveh.

Seriphos, 132, 141, 142.

Sicily, 56, 112.

Sicyon, 118, 382, 383.

Sileni, *see* **Satyrs.**

Silenus was one of the Sileni who brought up Dionysus and was his constant companion. He was a jovial, bald old man usually drunk and riding on an ass. He had the power of prophecy. *See also* 121.

Sinis or **Sinnis** was a robber living on the Isthmus of Corinth, where he killed travellers by tying them to the top of a fir-tree which he tied to the earth and then allowed to spring upright. He was killed in the same way by Theseus. *See also* 205.

Sinon, 329, 330, 333.

Sirens were sea-nymphs who could allure by their songs all who heard them. When the Argonauts sailed past, Orpheus surpassed them, and Odysseus contrived to hear them unscathed.

Sirius, the dog-star.

Sisyphus, son of Æolus, married Merope, the Pleiad, who bore him Glaucus. He seduced Anticleia, daughter of Autolycus, and mother of Odysseus, and some said that Sisyphus was really the father to Odysseus. He founded Ephyra, later Corinth, and though he promoted navigation, was a notorious knave (*see Iliad* VI, 153). In the Underworld he was condemned always to roll uphill a huge stone which always toppled back again.

Smintheus, a name of Apollo.

Sophocles, 197, 259, 260, 266, 322, 323, 391.

Sparta, 45, 64, 86, 282, 284, 285, 286, 385.

Sparti or "**Sown Men**," 243, 258.

Sphinx, 255, 256, 257.

Stentor, herald of the Greeks in the Trojan War. His voice was as loud as that of fifty men.

Steropes, 1.

Stheneboea, also called Anteia, 146.

Sthenelus. (1) Was the son of Perseus and Andromeda, and King of Mycenæ. His wife Nicippe, who bore him Alcinoe, Medusa, and Eurystheus.
(2) The son of Capaneus and Evadne, 268, 288, 328.

Stheno, 131, 138.

Strophius, 390.

Stymphalian Birds, 178.

Styx, 184, 294, 405, 406.

"**Suppliants, The**," 267.

Symplegades, 157.

Syrinx, *see* Pan.

Talaus, 261.

Talos. (1) Cretan giant, 228.
(2) Nephew of Dædalus, 237.

Tantalus, 251, 371, 372, 373, 374, 375.

Taphians, 165.

Tartarus, 4, 8, 9, 13, 14, 184, 400.

Tauris, 86, 300, 395, 396.

Tecmessa, 306.

Teiresias or **Tiresias**, 258, 259, 261, 270, 358, 360, 366. See Tennyson's poem *Tiresias*.

Telamon, son of Æacus, king of Ægina, joined with his brother Peleus in killing their half-brother Phocus and, expelled by his father, he went to Salamis, where he married Glauce, daughter of the king, whom he succeeded. Telamon later married Peribœa of Athens, who bore him Great Ajax. He joined in hunting the Calydonian Boar, and some say that he sailed with the Argonauts. *See also* 188, 189, 275, 276.

Telchines were variously described. It is said that Rhea entrusted the infant Poseidon to them and that they were artists in metal, making the sickle of Cronus and Poseidon's trident. But they were also said to be destructive beings, interfering with the weather, and earning the hostility of Apollo, who assumed a wolf's form to destroy some of them, and of Zeus, who overwhelmed others by flood.

Telegonus, 368.

Telemachus, 291, 363, 364, 365, 368.

Telephassa, 223, 240.

Telephus was the son of Heracles and Auge the priestess, daughter of Aleus, King of Tegea. He was abandoned as a child, but on reaching manhood questioned the Delphic Oracle as to his parentage. He was told to sail to King Teuthras in Mysia, and there found his mother married to the king. He succeeded Teuthras and was said to have married Priam's daughter Laodice. He tried to prevent the Greeks on their way to Troy from landing in Mysia. *See also* 299.

Telephylos, 357.

Tempe was a beautiful valley in Thessaly watered by the River Peneus. Apollo here pursued Daphne, daughter of the river-god Peneus. He had also purified himself here after killing the Python.

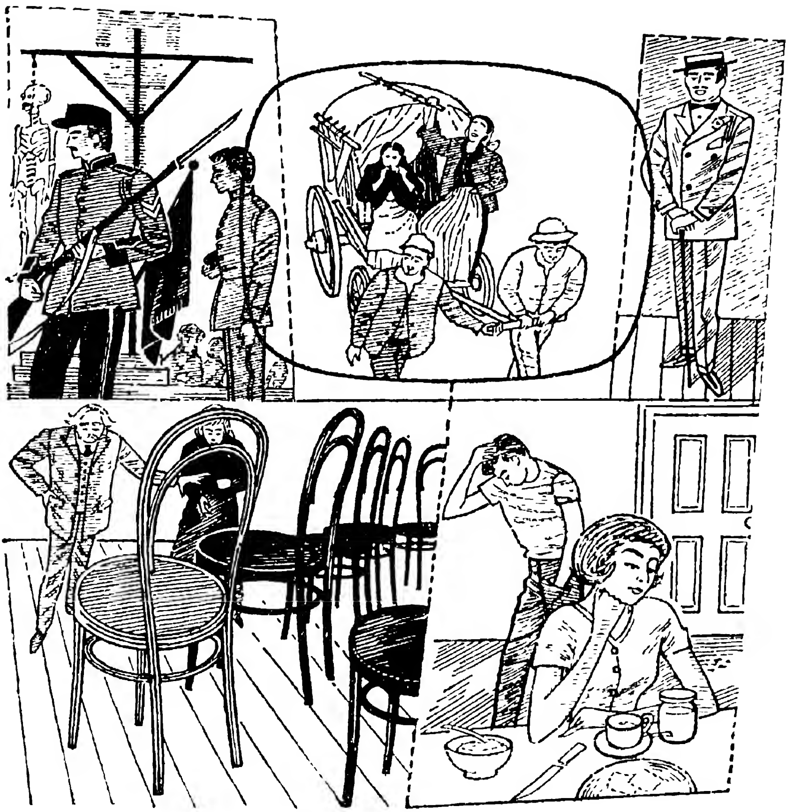
Tenedos, 301, 302, 329.

Tenes, son of Apollo, was reputedly the son of Cycnus, King of Colonæ in Troas. His step-mother, failing to seduce him, falsely accused him to Cycnus, who put Tenes, with his sister Hemithea, into a chest and threw it into the sea. The chest was driven to the island Leucophrys, whose inhabitants made Tenes king. The island was then called Tenedos. Cycnus, discovering his error, sailed to Tenedos and was reconciled with his son. When the Greeks landed on Tenedos on their way to Troy, Achilles killed both Tenes and Cycnus.

Tereus, a son of Ares, was King of the Thracians and lived in Phocian Daulis. He helped Pandion, King of Athens, and was therefore given Pandion's daughter Procne in marriage. She bore him a son, Itys. But Tereus was in love with Procne's sister, Philomela, and hiding Procne among the slaves, he told Philomela that her sister was dead, and so seduced her. He

11

Modern Drama



In recent years a new kind of theatre has been created under the influence of writers able to break with convention and experiment for themselves, making more imaginative use of stage and language. Here an account is given of the dramatic work of the leading British playwrights and the influence of foreign dramatists on the modern English theatre is discussed.

TABLE OF CONTENTS

Modern Drama

FOREWORD

This section is concerned with the most notable English playwrights of the last decade, and those foreign dramatists, European and American, who have most influenced them

It comprises three parts

I Influential foreign dramatists and their plays
II Individual English dramatists and their plays
III The true nature of drama

Plays produced only on radio or television will not be discussed, for those media demand different techniques, and the actual performance of a play on the stage before a live audience is still a social as well as an artistic experience unique of its kind No play should be judged by its film version, which often diverges widely

When a paper-back copy is available this is indicated after the play P for Penguin, M for Methuen, F for Faber and Faber

I. INFLUENTIAL FOREIGN DRAMATISTS AND THEIR PLAYS

In recent years many original and powerful dramatists from Europe and America have had their plays produced in this country, and their influence here has been considerable Some of the most outstanding have been the American Eugene O'Neill, the German Brecht, Ionesco, the leading exponent of the Theatre of the Absurd, and Sartre, the advocate of the politically 'committed' play

There now follows a brief account of these masters, and also of some lesser figures Their preoccupations and dramatic principles will be discussed, together with an account of those of their plays most familiar with English audiences.

Eugene O'Neill (1888 1953).

The greatest and most influential American playwright of this century is undoubtedly Eugene O'Neill, son of the romantic actor James O'Neill, and Irish in origin He is a prolific, virile, and compassionate author, who in his best work comes to close grips with the serious issues of human life, showing man in a harsh environment, struggling with his own inner passions and strong social forces He is deeply involved in his characters, often the flotsam and jetsam of humanity conceived with disillusioned compassion He has the power to create the kind of theatrical situation which grips and rivets the audience and on the stage his great gifts go far to compensate for a looseness of structure and a dialogue which is singularly flat, poor in vocabulary, and lacking in rhythm His plays are better acted than read

O'Neill was in some sense a pioneer His problem was that of all artists, to translate the crude experience of life into artistic form But it was intensified for him by the fact that in America he had no benefit of a disciplined artistic tradition, such as that in Europe, within which he could begin to work He therefore experimented in many different European styles, such as German expressionism, and symbolism, trying to apply them to the harsh experience of life, not always with success The style that he eventually made his own is a faithful realism that yet suggests haunting emotional and reflective overtones

From 1934 until 1946 O'Neill refused to let his new work be staged but he continued his writing, which included *The Iceman Cometh* (1946), *A Moon for the Misbegotten* (1947), and *Long Day's Journey into Night*, all of them produced in England in the 'fifties, but it is the first and the last which made a great impression

The Iceman Cometh.

This is a play of deep despair, suggesting that only by the protection of self-deceit can some men bear to exist at all This is the theme of Ibsen's *The Wild Duck* The basic pattern of the play is that of Gorky's *The Lower Depths*

Long Day's Journey into Night.

This is another pessimistic work, brightened by one gleam of hope. The subtle love-hate relationships are unfolded with sensitive insight and the play is particularly significant, for it is frankly autobiographical In view of his experiences it is not surprising that O'Neill should feel an affinity with Strindberg and with Freud

The Influence of O'Neill—There is a striking similarity between much of the work of O'Neill and that of many modern British playwrights, particularly Wesker and Alun Owen Like him they are deeply committed to individual people rather than to rigid social and political doctrine, and especially to working people living insecurely in a tough environment Like him they reveal the subtle ties that bind members of a family or gang, and the difficulties in breaking free—subjects which lend themselves to the same rather sprawling and diffuse structure and a dialect style Up to the present few plays have achieved the passionate and gripping intensity which is O'Neill's at his best

More recent American influences have been Thornton Wilder, Tennessee Williams and Arthur Miller

Bertold Brecht (1898–1956).

The Bavarian-born playwright, Bertold Brecht, has had a wide influence, both as dramatist and producer His plays fall into three periods Those of the first were characterised by a dislike of romantic sentimentality, an anarchic, satiric attitude, and the conviction that the theatre should provide entertainment In 1928, the ironic *Threepenny Opera* made him famous From 1930, Brecht's plays became explicitly communistic, and were marked by their rejection of the individual in favour of a social ideal, but in 1933 he was forced to flee from Nazi Germany and his plays were banned It was while in exile, eventually in America, that Brecht wrote the plays that have since been the most frequently performed in this country—*Mother Courage* (M), *The Life of Galileo*, and *The Good Woman of Setzuhan*. The well-known play *The Caucasian Circle* was written later in 1944-5 Apart from the prologue to the latter, these plays are rather humanist than propagandist

In 1949 Brecht finally settled in East Berlin and built up the Berliner Ensemble, where he developed his influential techniques of production. Although Brecht's theory and practice underwent development, and even contradiction, some of his ideas remained constant

The most marked and lasting characteristic of his Theatre is its *Verfremdung*, which has been translated as "estrangement" or "alienation" This implies using an image that makes the familiar suddenly appear strange to the spectator, so that with a shock of recognition he realises what is amiss in society and decides to put it right It is taken for granted that communism will be the solution Brecht developed this concept in reaction to the producers Reinhardt and Piscator, who

both emphasised the need for the imaginative and emotional participation of the audience in the events on the stage. In 1931 Brecht, endeavouring to break down this participation, and to endistance the action from the spectator, worked out a formula for a new kind of 'Epic' play, which he contrasted with what he called the "Aristotelianism" then prevailing. Brecht's view was that the Aristotelian form (*see* **16**), by involving the spectator, and purging him of fear and pity, used up his emotional feeling and rendered him a passive member of society. According to Brecht, the spectator should be not emotionally involved but a detached and distant observer, investigating the view of man and the world that confronts him, using his powers of reason to consider and debate arguments, and stimulated to making his own decisions.

The form of play best suited to this is the 'Epic,' or narrative, with a loose sequence of scenes, each scene existing in its own right.

Striving to make us think rather than feel, Brecht discourages hero-worship, and even puts to the question the value of an absolute standard of ethics, nobly adhered to. Many of his central figures are presented ambiguously, as both time-servers and benefactors, as, for example, in the dialectical treatment of Galileo's recantation.

As would be expected, Brecht's productions were not realistic but avowedly theatrical, sometimes appearing like an inspired charade. He used not only narrative but direct address to the audience, formalised setting and properties, masks, and stylised make-up, sometimes grotesque in character. His production was frequently evolved in rehearsal, numerous alterations being made up to the last moment. For this reason knowledge of his pattern of mime and gesture is sometimes essential to the full understanding of his plays. Although we cannot point to any one English writer as a disciple of Brecht in ideology and technique, yet many individual plays and productions show the influence of his fertile thought and invention.

Above all, his iconoclastic attitude and vigorous experiment have served to break down hide-bound conventions so that many modern English dramatists have been encouraged to experiment for themselves. It is in this new empirical attitude that Brecht's influence is most pervasive and valuable, especially in the work of Arden, Osborne, Whiting, and Bolt. Kops, also, in his uninhibited spontaneity, and Joan Littlewood, in her experiments in production, have benefited from his pioneer efforts.

•

Eugène Ionesco (b. 1912).

In post-war Paris, what is now dubbed the Theatre of the Absurd has been served by many gifted dramatists, including Genet, Vian, Adamov, Beckett, and Ionesco. Apart from Beckett it is Ionesco who has proved the most original and influential.

Ionesco was born in Roumania of a French mother, and his childhood and later life were spent in Paris. In 1948 his first play, *The Bald Prima Donna*, was written almost by an accident. Ionesco's work is diametrically opposed to that of Brecht, in that he deliberately repudiates the ideological play with a didactic message, believing that the human condition is wider and deeper than the social condition. But his plays belong inextricably to the contemporary world, characterised as it is by a flight from reason, tragic in its potentiality. He is especially critical of the myopic existence of the bourgeoisie, devoid of feeling and thought, absurd in its conventional emptiness. He exposes this not through the arguments of reason, as does Sartre, but through images that are themselves absurd and yet at the same time poignant, for their significance is human folly and failure. In this way hilarious comedy may have a tragic import, and so the familiar dividing lines between the traditional forms of tragedy and comedy melt away.

Deeply aware as he is of the hidden fears and anxieties that haunt men today, Ionesco believes that by exploring his own inner experience he touches that of all mankind, as is clearly stated in *The Shepherd's Chameleon*.

The inner anguish felt by Ionesco at life's absurd cruelty manifests itself to him in a curious state of consciousness, a crushing sense of heaviness. This leads him to use solid objects (like chairs or eggs) to externalise the anxiety of his characters "to make the stage settings speak, to translate action into visual terms, to project visible images of fear, regret, remorse, alienation." He believes that experiments of this kind better express the reality of human experience than a careful social realism. Ionesco, indeed, discards far older dramatic techniques than that of realism, including the concept of the Aristotelian play (*see* **16**). As Nicolas gaily says in *Victims of Duty*, "We'll get rid of the principle of identity and unity of character . . . As for plot and motivation, let's not mention them . . . no more drama, no more tragedy, the tragic's turning comic, the comic is tragic." Even language as a dramatic medium undergoes Ionesco's scrutiny, for he is vividly aware of the inadequacy of a language which has become "nothing but clichés, empty formulas and slogans" and he attempts to split it apart "to find the living sap beneath."

Discarding so much, Ionesco has evolved a new technique of shock tactics. What is needed is "to go right down to the very basis of the grotesque, the realm of caricature, to transcend the pale irony of witty drawing-room comedies—to push everything to paroxysm, to the point where the sources of the tragic lie. To create a theatre of violence—violently comic, violently tragic."

His aim is to shock us into realisation of the empty life of the petit bourgeois, the lack of passion and feeling, the yielding to the pressure of convention, the urge to conform, the meaningless stereotyped language.

The discarding of proved theatrical techniques is a risky undertaking. Shock tactics are successful as long as they surprise by their novelty. It is a measure of Ionesco's talent that he continues to invent the novel and arresting.

Many of Ionesco's plays have been performed in this country, including the following, which are very revealing of his chief preoccupations and his technique.

The Bald Prima Donna. Written 1948.

Ionesco was learning English from a primer when he became acutely aware of the platitudinous nature of the sentences he was learning by heart, especially a dialogue where, to his astonishment, "Mrs. Smith informed her husband that they had several children, that they lived in the vicinity of London, that their name was Smith." Later their friends, the Martins, arrived and they continued to exchange truisms. The Smiths and Martins came alive in Ionesco's mind and poured forth their clichés in a 'parody of a play,' which he first considered to be a 'tragedy of language,' but which, when acted with deadly seriousness, proved extremely funny. Thus Ionesco stumbled upon his vocation and wrote the first of many satirical exposures of the sterility of language of those who have come to live a merely mechanical existence. As the author says, "The Smiths and Martins can no longer talk because they can no longer think; they can no longer think because they can no longer be moved, can no longer feel passions." They have indeed lost their identity.

Jack. 'A naturalistic comedy.' Written 1950.

Jack, the Bohemian son, tries to resist the pressure of his bourgeois family but is at last persuaded to pronounce the test words, "I adore potatoes with bacon." Urged to settle down to married life, he resists Roberte, the proposed bride, because, having only two noses she is not ugly enough, but he eventually succumbs to Roberte II, with three noses. Through this ludicrous situation Ionesco parodies submission to the conformity of bourgeois life and marriage.

The Future is in Eggs. Written 1951.

In this sequel to *Jack*, their conventional families persuade Jack and Roberte to assure the continuity of the white race by hatching endless baskets of eggs.

The Lesson. Written 1951. P.

In this one-act play a nervous old professor gives a private lesson to an eager young girl. He elaborately 'proves' the impossibility of communicating by words which have different personal associations for different individuals. Arbitrarily

deciding what various words shall mean, he rapidly gains assurance and power, until he eventually rapes and murders his pupil, the fortieth whom he has so killed that day. Ionesco here illustrates the use of language as a means to power, the sexual element in power, and the sadism lurking in authority.

The Chairs. Written 1951. P.

This 'tragic farce' is set in a tower on an island, where the old concierge and his wife, both over ninety, are preparing for a crowd of guests who are to hear the old man's final message to posterity. As the totally invisible guests arrive, the couple fetch more and more chairs for them, while engaging them in polite platitude. When the stage is thronged with empty chairs, there arrives the professional orator who is to pronounce the message, and the old couple jump into the sea. But the orator is deaf and dumb, and what he writes on the black-board is a meaningless jumble of letters.

The empty chairs are a most effective dramatic image for man's failure to communicate. The appearance of the dumb orator makes the record of a lifetime's experience utterly futile. Ionesco himself defines the subject of the play as "the chairs themselves, that is to say, the absence of people . . . the absence of God . . . the unreality of the world, metaphysical emptiness. The theme of the play is *nothingness* made concrete."

Victims of Duty. 'A pseudo-drama'. Written 1952.

By the transformation of a detective into a psychoanalyst, Ionesco demonstrates his view that there is little difference between psychological drama and the mere detective play.

Rhinoceros. Written 1958. P.

In a small provincial town, first two and then progressively more and more rhinoceroses appear. They are the inhabitants, who one after the other want to be turned into these thick-skinned, powerful and aggressive animals. At the end only Berenger and his beloved Daisy resist the temptation to do as the rest. Then Daisy also capitulates and he is left alone. The terrifying lure of conformity is here skilfully and movingly presented. Ionesco himself has commented on the "veritable mental mutation" which overcomes those who "allow themselves suddenly to be invaded by a new religion, a doctrine, a fanaticism. . . . People thus transformed not only resemble rhinos, but really become rhinoceroses."

Ionesco has had a marked and specific impact on English drama, especially on Simpson, Saunders, and Campton and although Pinter has a philosophy and style all his own, his work is based on similar presuppositions.

Jean Genet (b. 1910).

Genet has lived as a criminal and social outcast, and, while remaining politically 'uncommitted', has mirrored his bitter repudiation of society in plays of frightening power. They have been *Deathwatch* (1949) (F), *The Maids* (1947) (F), *The Balcony* which had its world première in London in 1957, and *The Blacks*.

Arthur Adamov (b. 1908).

Adamov at first wrote plays such as *Professor Taranne*, which translated his own personal neuroses into images of the absurd, until with the propagandist *Paolo Paoli* (1957) he adopted a Brechtian technique. His *Spring 1871*, an epic panorama of the Paris Commune, had its world première in London in 1962.

Max Frisch (b. 1911).

The German-Swiss Frisch has, in *The Fire-Raisers* (M), produced an incisive dramatic parable of absurd bourgeois self-delusion.

Friedrich Durrenmatt (b. 1921).

Frisch's fellow-countryman, author of *The Visit*, and *The Physicists*, describes his own work as "theatre of paradox."

The Existentialists: Sartre and Camus.—An atheistic type of existentialism was developed in France between the wars and during the Occupation. Among the dramatists the leading exponents are Sartre and Camus.

Jean-Paul Sartre (b. 1910).

The philosopher, and novelist Sartre, has written several plays which can be fully interpreted only in the light of his basic convictions, which the serious student will need to study in some detail.

It may, however, be helpful to remember that Sartre is an atheist hostile to traditional morality, insisting that the individual man must evolve his own ethical code through daring freely to choose and act for himself. Willing this freedom for himself, he must also will it for others, and by seeking to establish this interdependence of freedoms he 'engages' or 'commits' himself in the political struggle. Sartre himself is a communist.

Like his hero in *La Nausée*, Sartre experiences a peculiar horror at the irrationality of the natural world. For him the essential absurdity of man's predicament is that of a rational creature in an illogical and hostile universe. But, unlike Ionesco, he presents this absurdity through the medium of the traditional well-made play.

Apart from *In Camera* (P), Sartre's best plays have been political and fully 'committed,' seeking to vindicate the inevitability of violence in the struggle for freedom and to decry the 'bourgeois morality,' which shrinks from such crime.

The Flies. 1943. P.

Orestes, defying conventional religion and morality, as represented by Zeus, assassinates both the usurping monarch and his own mother without yielding to remorse. Understandably the play was suppressed by the German Occupation. It clearly illustrates the existentialist view of the need for individual freedom in ethics.

Crime Passionel. 1948. M.

The bourgeois idealist, Hugo, a convert to communism, still shrinks from political assassination, and brings himself to kill Hoederer only when motivated by sexual jealousy.

The Devil and the Good Lord. 1951.

The dilemma between non-violence and force is given greater universality by being projected back to the time of the Peasants' Revolt in Germany. The play shows the inner struggles of the brilliant general, Goetz. His policy of Christian love having failed, he unflinchingly embraces a ruthless violence as the only possible 'realist' social ethic.

Nekrassov. 1955.

In a satirical farce, Sartre ridicules the sensational anti-communism of a section of the popular French press.

Altona. 1956. P.

In an obscure and laboured play, Sartre attacks 'Western morality' in its recourse to torture (used by the French colonials in Algeria). He shows a former Nazi officer going mad in an attempt to justify his own resort to torture.

In Camera. 1944. P.

A brilliant and terrifying play embodies Sartre's existentialist and psychological theories. It is set in the 'hell' of a Second Empire drawing room, where two women and a man discover that "Hell is other people."

The imagery of Sartre's dialogue is sometimes heavy and monotonous, reflecting his obsession with a material world which seems to him messy, sticky, and visceral.

Sartre has had a great influence on the climate of opinion. Some of our dramatists reveal a similar attitude of harsh disillusion, and he has certainly helped to prompt the current discussion as to whether or not drama should be a vehicle for social and political convictions. It is interesting to contrast the views of Wesker and Pinter on this issue.

Albert Camus (1913–60).

Like Sartre, Camus was an existentialist dramatist who used the traditional form. *Cross Purposes*, 1944, and *Caligula*, 1945, are his best known plays.

Jean Giraudoux (1882–1944).

Giraudoux is perhaps the leading French dramatist of the 'thirties, and his plays reveal a keen intellect, deep emotional feeling, and a true sense of poetry. He frequently uses classical legends as a vehicle for the treatment of contemporary issues, as in the delicate comedy *Amphitrion 38*, produced here by the Lunts, and in *La Guerre de Troie n'aura pas Lieu*. Translated by Christopher Fry as "Tiger at the Gates" (M), this play protests against the horror of war. *Pour Lucrèce*, or "Duel of Angels" was a posthumous play. Giraudoux's contribution has been to encourage the return of poetry to the stage, and it is significant that Christopher Fry has been his translator.

Jean Anouilh (b. 1910).

Anouilh is a playwright of remarkable theatrical skill, who owes much to Giraudoux. Like him, he has frequently turned to classical themes, as *Eurydice* (M), and *Antigone* (M). More recently he has treated historical figures, Saint Joan in *L'Alouette*, or "The Lark" (M), and "Becket" in the play of that name. Anouilh's outlook is deeply pessimistic and ironic. He himself classifies his plays into the tragic *pièces noires*, and the *pièces roses*, plays of romantic fantasy. They have been extraordinarily popular on the London stage of the 'fifties. Anouilh's cynical and amoral attitude is reflected in many popular West End plays, and his skill and versatility have been a constant challenge.

The Aristotelian Play.

Of recent years Brecht, Ionesco, and others have discussed what they call the Aristotelian play. By this is meant the concept of tragedy first analysed by Aristotle in his *Poetics*, and based primarily on the tragedies of Sophocles, especially the *Oedipus Rex* (P), which was performed about 425 B.C.

The Aristotelian concept, developed by serious European dramatists during two millenia, has obviously been much modified, but certain basic principles can still be clearly discerned.

Aristotle claims that poetry in general aims at pleasure—that rational pleasure which is part of the good life—and he defines tragedy as the imitation of an action which is complete in itself. Tragedy must have a beginning that is comparatively intelligible, a middle which is necessitated by the beginning, and which itself necessitates the end. Aristotle insists on the unity of the action, saying, "The story ... must represent one action, a complete whole, with its several incidents so closely connected that the transposal or withdrawal of any one will disjoin and dislocate the whole."

The action must be of some magnitude, with "incidents arousing pity and fear wherewith to accomplish the purgations of such emotions." Here is Aristotle's celebrated doctrine of 'purgation' or 'catharsis,' which has been variously interpreted, some considering that something like a ceremonial purification is intended, with an ethical aim in view, others that a bodily or psychological relief from tension is meant, leading to 'calm of mind, all passion spent.'

In comparing the different elements of plot and character, Aristotle emphasises the importance of plot. The characters are revealed in and through the action, which is of paramount import.

The kind of plot recommended is one where the tragic hero is a man of great reputation and prosperity, not inordinately good or bad, but "the intermediate kind of personage, a man not preeminently virtuous and just, whose misfortune however is brought upon him not by vice, and depravity but by some error of judgment."

We recognise in all this the germ of the splendid Renaissance tragic drama concerned with the fall of princes, and also of the modern well-made play, as realised in the best work of Ibsen, *The Doll's House*, for example. Such a play has a classical symmetry and shape, the beginning, middle, and end, becoming in modern parlance, the exposition, the development, and the climax, or dénouement. Such a play has its own inner unity and inevitability. But although many modern writers, such as Sartre, still strive to work within its disciplines, many have discarded the traditional form.

In this age of the common man few are concerned with the princely hero, and Brecht and his followers have repudiated the whole pattern in favour of a sequence of self-contained episodes like beads on a string, where ironic detachment supersedes the emotional involvement and catharsis of Greek tragedy.

It is interesting to examine some of the modern plays that have moved us most, *Waiting for Godot* (F), say, or *The Caretaker* (M), or *Serjeant Musgrave's Dance* (M), and to ask how far they stand up to the Aristotelian canon. Should we today evolve a new concept of tragedy—that of potentiality unrealised, not a fall from greatness but a failure to rise?

II. INDIVIDUAL ENGLISH DRAMATISTS AND THEIR PLAYS

There now follows an account of the chief English dramatists writing in the last decade, and of their most significant plays. The authors have been grouped, for convenience of reference, according to their prevailing preoccupations and style. Each play is dated by its first British production.

1. THE NEW SOCIAL REALISM.

One modern trend in the English theatre is towards a detailed social realism in depicting the lives of working people. There is nothing new in social realism as such. Ibsen was a master of this style, but he used it to present the homes of the upper middle-class. What is new is the starkly realistic picture of the shabby homes, lodgings, and streets of the poorer sections of the community and the down-and-outs. Gorky, in his play, *The Lower Depths*, showing the extremes of destitution in a Moscow cellar, was perhaps the innovator, but the 'kitchen sink' or 'dustbin' background is now as much a vogue as the middle-class drawing-room scene was between the wars.

Several of the authors of this realistic drama are themselves of working-class origin and know what they are talking about, so that their plays have a peculiarly authentic ring, although they are sometimes unconventional in structure, a fact that may again be attributable to the author's background, and an education that has not been on academic lines.

Arnold Wesker (b. 1932).

Arnold Wesker, son of a Jewish-Hungarian father and a Russian mother, first became a pastry-cook, and worked for four years in Norwich, London, and Paris, before taking a six months' course at the London School of Film Technique, where he wrote the first play of his trilogy, *Chicken Soup with Barley*.

The Wesker Trilogy.—The trilogy consists of three realistic plays in which a discursive history of the Jewish family, the Kahns, is fused with a political debate on the course of socialism between 1936 and 1959.

Chicken Soup with Barley. 1958. P.

This is the springboard of the trilogy. It is October 4, 1936, the morning of Mosley's attempted march through the East End, when the curtain rises on the Kahns' basement flat. The wife, Sarah, vigorous and warm-hearted, is a communist and her amiable but weak husband, Harry, is apathetic. As the years pass the young son, Ronnie, fully shares Sarah's political enthusiasms, but Ada, the daughter, now married to Dave Simmonds, one of the young enthusiasts of 1936, has become disillusioned by the stupidity of her fellow-workers, and when Dave is demobbed, they settle in the country. The shiftless Harry, losing job after job, becomes senile. Ronnie, outwardly buoyant, watches his father's degenera-

tion with horror "I watch you," he says, "and I see myself and I'm terrified"

Finally, in 1957, Sarah, left alone, anchored to Harry, faces her worst disappointment when Ronnie, now a chef, returns from Paris having lost all faith in political action In losing ambition he now understands his father and believes that he is like him It is Sarah he accuses, because having over-simplified the issues, she is still not facing realities, either personal or political At this point Sarah makes her great plea The vital thing is to care The wrong in Harry was that he didn't care

The central theme of the play is the conflict between two attitudes of mind, 'caring', or concern for others' welfare, and indifference to it The battle is fought out on two fronts, in the home and politically, it being taken for granted that socialism is an expression of 'caring,' and the stalwart Sarah is the centre of this two-fold conflict, for she attacks both social inertia and that of husband and son

Meanwhile the theme of disillusion is adumbrated in a minor key Sarah is forced to watch Harry's inexorable disintegration, the political disillusion of her c[illegible] and the sapping of Ronnie's will It is only Ronnie's honesty with himself and Sarah's unshakable faith in 'caring,' that save the play from ending on a despairing note

Each of the Kahns is a real human being, escaping the categories of black and white, presented not for our moral judgment, but for our sympathy and involvement Especially commanding is Sarah What Jung might call an 'extraverted feeling type,' she is ignorant of events, contemptuous of books, a strenuous mother figure, and yet in her aggressive dynamic, the most masculine figure of the group

The idiosyncratic dialogue deftly catches the eager volubility of this volatile Jewish circle

Structurally the play is sprawling, but Wesker shows an intuitive grasp of that essential of drama —movement There is in scene one an imaginative leap forward, a rising muscular arc as the little band of fighters surges forward from the basement to the light, the exhilaration heightened by the thronging movement and cries from the streets above A more experienced dramatist would probably have used such a triumphant movement for a climax to the whole play, whose final pattern is of recoil and listlessness, held only by Sarah's will and Ronnie's honesty But the feeling for movement is a rare talent and in his latest work Wesker deploys it with great skill

Roots 1959 P.

There is here a skilful shift of scene to Norfolk, where Beatie Bryant, a farm labourer's daughter, on holiday from London, is staying with her family Beatie links the two plays, for she is engaged to Ronnie, who over the last three years has deliberately tried to transform her, endeavouring to teach her to read, to hear classical music, and above all to use words intelligently She has in fact ignored his advice but she endlessly parrots his sayings to her phlegmatic family

The Bryants, preoccupied with the primal necessities of life, are the coarse roots from which Beatie has sprung In spite of a rough friendliness, they are ignorant, prejudiced, stubborn, and incapable of expressing and communicating ideas

When on the appointed day Ronnie fails to turn up but sends a letter explaining that "it wouldn't work," for Beatie had ignored all his suggestions, Mrs Bryant turns on her daughter Her only thought is that she has been proved right and that Beatie has not changed after all "The apple don't fall far from the tree, that it don't," she cries vengefully But Beatie is at last galvanised by shock into finding thoughts and words of her own These folk she realises are without spiritual roots and without standards "The whole stinkin' commercial world insults us and we don't care a damn Well, Ronnie's right—it's our own bloody fault We want the third-rate—we got it!" Then comes the ecstatic moment of self-realisation She is at last thinking and speaking for herself

The play ends as Beatie cries "God in heaven, Ronnie! It does work . on my own two feet—I'm beginning" Although he is not to know it, Ronnie has realised his ambition to "save someone from the fire."

Talking about Jerusalem. 1960 P

To the consternation of all the Kahns, in 1946, Dave and Ada Simmonds settle in the depths of the country. Dave, now believing the basic evil to be industrialism, tries to practise the theories of William Morris by making furniture by hand. But he fails to sell this at an economic price, and in 1959 as the third Conservative majority is announced on the radio, the Simmonds pack up for their return to town

The theme of disillusion is here fully analysed as the family, all self-conscious and voluble, struggle to define their changing attitudes But the mood escapes despair Dave, his vision faded, hangs on to self-respect and his sober appraisal of unpalatable facts is contrasted with the embittered cynicism of a wartime pal, Libby Dobson, formerly an idealistic follower of Robert Owen

It is Ronnie who for a moment sinks to his knees "in utter despair," for Dave's return brings home to him his own failure (and that of his father) to carry anything through to the end, even his love affair with Beatie But finally Ronnie, although ignorant of what he has done for Beatie, in a symbolic movement, rises to his feet

Aesthetically, this play is unsatisfactory. There is insufficient action, and Dave, unlike Sarah and Beatie, is not a sufficiently commanding figure to hold the thing together Then it is an extremely intimate study of the tenderness and tension of family relationships, suitable to a novel, read in private but embarrassing, except in brief moments, on the public stage

There are two unrealistic incidents in Act II One is where Ada and Dave silently mime a simple ritual of forgiveness and reconciliation The other is a brief idyllic moment where the young parents and their eldest child symbolically enact the story of creation

These scenes have something of the naive poetry of the mediaeval morality play, and may possibly herald a new style

The Trilogy as a Whole—Wesker's trilogy poses for our consideration vital questions of good and evil, both personal and social, the chief, perhaps, being that of heredity Is man foredoomed and his struggle vain? Is Mrs Bryant right when she asserts, "The apple don't fall far from the tree"? Harry also had said, "You can't change people, Ronnie" But he had added, "You can only give them some love and hope they'll take it" Harry had also appealed to a profound intimation of hope "It'll purify itself," for he believed that whereas capitalism contains the seeds of its own destruction, socialism contains the seeds of its own purification.

The Kitchen 1959 P

In this two-acter, Wesker draws on his experience as chef to give a vivid impression of a day in a restaurant kitchen

It is notable for its skilful contrasts in pace and movement The quiet morning quickens to a relentless frenzy of anxiety at the lunch-time serving, and the doldrums of the afternoon are succeeded by the violent outburst of the German, Peter, who suddenly goes berserk

The swirling vortex is an image of the blind activity of our society, and, while avoiding rigid allegory, Wesker indicates that this kitchen is a microcosm of a world where men with their fleeting contacts find themselves in a situation beyond their grasp

The play ends with the dramatic irony of the restaurant owner's unpercipient questioning, "I don't know what more to give a man. He works, he eats, I give him money. This is life, isn't it?"

Chips with Everything 1962

Wesker's latest play is a direct and explosive missile aimed at the complacent arrogance of the rulers and the inertia and servility of the ruled

He makes a break with realism and in brief and stylised scenes shows a group of nine conscripts at a R A F station They are subjected to a battery of bullying abuse from the corporal and psychological manipulation by the commissioned officers, until, their personal identity submerged, they learn to move as one unit, and pass out to the

blaring of a military band and "God Save the Queen"

In the process two men are broken, one the gentle Smiler, the other Thompson, or Pip, an equivocal figure, central to the play.

A public school boy and the son of a general, Pip is resistant to authority and like Ronnie Kahn, he tries to rouse his fellows to realise their own potentiality, and transforms a Christmas Eve party from rock'n roll, the officers' idea of appropriate entertainment, to the singing of folk ballads. But the habits of a class of people who can "eat chips with everything" are distasteful to him. He is accused by the recruits of 'slumming,' and assailed by the blandishments of the officers who want him to become one of them. Eventually, after refusing to take part in bayonet practice, he suddenly capitulates, and assumes the uniform of an officer.

Wesker's deep conviction of the workers' need to share in cultural advantages has indeed lent to the play something of the distortion of a personal dream. The recruits' sudden conversion to folk ballads and Pip's equally sudden recantation seem to reflect the fluctuations of subjective hopes and misgivings in an otherwise firmly objective picture.

This complex play is remarkable, in that a study in some depth of Pip's personal conflicts and disintegration is woven into a shattering satire on the Establishment, all the more effective for its heartfelt protest at the stupid apathy of those who let themselves be governed.

The overall effect is tense and powerful, and the scenes of moving comedy alternate with those where the audience, facing the same direction as the recruits themselves, feels the obliterating effect of military discipline, the relentless forward thrust and punch that again reveals Wesker's sense of movement.

Conclusion.—The most individual characteristic of Wesker's plays is his passionate involvement with his characters. He not only loves them but can be exasperated and angry with them. This deep concern is his strength and has also proved his weakness for it has sometimes disturbed that objectivity characteristic of the world's greatest works of art. It is in *Chips with Everything* that he comes closest to that high ideal of passion in control.

Henry Livings (b. 1929)

Livings left Liverpool University at the end of his second year, for two years' service in the R.A.F., and then became an actor.

His realistic comedies are concerned with working people. Although they are loosely worked out through hilariously farcical situations, yet they operate on two levels, and have a deeper significance which is so lightly indicated as not to disturb the comic temper. He has written both for the stage and for television.

Stop It, Whoever You Are. 1960. P.

A lavatory attendant in a factory, a meek little man named Perkin Warbeck, is involved in a series of ludicrous mishaps, but indirectly gets his own back on his harsh and frigid wife, and his mean and pompous landlord, Alderman Oglethorpe.

The realistic and farcical comedy culminates with a fantasy-like scene of Warbeck's death, a séance and a gas explosion. It is very funny indeed, and it also makes a plea for the insignificant people who support the social edifice.

"Alderman Oglethorpe . . . a giant among men," says Perkin's ghost in the seance. "I expect you thought he stayed up there by magic like the Indian rope trick? . . . Well, he doesn't. He stands on the heads of the likes of you and me. And I shifted over a bit."

Big Soft Nellie. Originally called "The Thacred Nit."

This again is a farcical comedy whose hero is one of the disregarded.

Nil Carborundum. 1962.

The scene is the kitchen of a R.A.F. station and the action culminates in a riotously funny mock commando raid, which also exposes the ridiculous anachronisms of the routines of Service life in a nuclear age.

Alun Owen (b. 1926).

Of Welsh stock but with an Irish mother, Owen was Welsh-speaking until the age of eight, when his parents moved to Liverpool—the scene of several of his plays. Most of his work has been for television but in 1957 he worked on two plays simultaneously, both of which reached the stage in 1959.

Progress to the Park. 1959. P.

In its final form this play illustrates one of Owen's most characteristic styles.

It is a leisurely enquiry into the life of working people in Liverpool—especially of a group of four young men and a girl—penetrating their personal affinities and animosities, as they drift about in street, pub, and park. The flavour of Liverpool dialogue has been skilfully caught. The clash of race and religion—the Southern Irish, Ulster folk and Welsh—is always just below the surface and threatening to erupt. The thread of story concerns the crossing of young love by parental prejudice, for Bobby Laughlin, the son of a fanatically Protestant Ulsterman, has been kept apart from his childhood's sweetheart, Mag Keegan, the daughter of Roman Catholic Irish. Bobby, just returned from sea, discovers that Mag, although she has always loved him, has been going with his amoral friends, and it is unlikely that they will ever be able to make up their differences.

The most lively and interesting character is Teifon, the voluble Welshman, who was originally a kind of commentator.

The Rough and Ready Lot. 1959.

This play is very different, in that its carefully constructed story is played out in a historical setting, in a revolutionary army in South America, just after the American Civil War.

Willis Hall (b. 1929).

Hall's plays have been realistic portrayals of working-class life.

The Long and the Short and the Tall. 1958. P.

What remains Hall's best play presents a group of N.C.O.s and Privates sheltering in a hut in the Malayan jungle in 1942. A captured Japanese soldier acts as catalyst, and the cockney Bamforth, like Jimmy Porter, an angry blasphemer of authority, is unexpectedly revealed as the only man ready to spare his life. The accidental shooting of the Jap advertises the party's whereabouts and all but a sadistic corporal are killed.

Hall later collaborated with Keith Waterhouse in North country comedies such as *Celebration* and *Billy Liar*. The latter, although original and amusing, lacks the finesse and variety of Waterhouse's novel, on which it is based.

John Mortimer (b. 1923).

Mortimer first became known through his short plays, such as *The Dock Brief* (1957), *I Spy*, and *Lunch House* (1960. M.) originally written for radio and television. *What Shall We Tell Caroline?* was his first work written directly for the stage.

These short plays exemplify Mortimer's chief dramatic talents, especially his gift for seizing on an unusual encounter between humdrum or disappointed folk. He has said that comedy should be "truly on the side of the lonely, the neglected, the unsuccessful," and he envisages them in realistic settings of shabby gentility.

He is especially sympathetic to those who allow their fantasy to overlap or swamp actuality, as in *The Dock Brief* and *What Shall We Tell Caroline?*, where after a brief glimpse of reality the characters return to the safe shelter of illusion.

In *The Lunch Hour*, however, the man so bewilders himself and the girl with his vivid fantasies that he destroys their tenuous contact.

His full-length stage plays, like *The Wrong Side of the Park*, lack substance.

Two Stars For Comfort. 1960.

Here Mortimer appears to have inflated the situation of *Collect Your Hand Baggage* (M).

There is the same middle-aged Bohemian, accompanied by a quartet of youngsters, and "conferring himself as a favour" on a plain girl

The play is flawed by sentimentality and Mortimer has debased the gospel of D H Lawrence, with its avowal of sensuous joy and passion, to one of casual pleasure, and has given an anaemic version of the Australian play, *The Summer of the Seventeenth Doll*, by Ray Lawler, devoid of the psychological insight and intensity that made that play so moving.

Mortimer's qualities are best seen in his broadcast and television plays Here the brief glimpse of a man talking to himself, a snatch of conversation overheard, a moment of pathos and pity, can have a telling effect, although they are not strong enough to bear the weight of a full-length play

Shelagh Delaney (b. 1939).

The plays of Shelagh Delaney were produced by Joan Littlewood in a kind of Brechtian style, but in view of the basic realism of their subject and style they are grouped here with other realistic plays

Shelagh Delaney is a Salford girl from a secondary modern school, and her plays owe their attraction to their fresh and artless picture of a handful of workers, stall-keepers, and hangers-on whom she evidently knows at first hand

A Taste of Honey 1958 M

After seeing Rattigan's *Variations on a Theme*, the seventeen-year old Shelagh Delaney decided she could do better herself and sent the script of *A Taste of Honey* to Joan Littlewood, who made several improvements, without impairing its spirit, and produced the play in 1958

It shows the feckless Helen bringing Jo, her seventeen-year-old daughter, to a dreary flat in Manchester Just before Christmas, Helen leaves with Peter, her flame of the moment, "a brash car salesman," her junior by ten years Jo, left alone, has a brief love affair with a coloured naval rating and becomes pregnant She makes friends with Geoff, a gentle art student, who takes charge of the household When Helen's marriage breaks down, she returns to care for her daughter, and Geoff is expelled

The centre of interest is Jo's relations with Helen and Geoff Helen had been married to a Puritan, and Jo was the offspring of the love affair of an afternoon Helen has never "laid claim to being a proper mother," but has made no smothering demands on Jo "It's your life, ruin it your own way," she says, and the two bicker on equal terms

The friendship between Jo and Geoff is drawn sensitively The girl after her brief taste of pleasure shuts herself away from life and sex, attempting to come to terms with her predicament The homosexual boy finds in his vicarious relationship with Jo a passionless satisfaction for his desire for fatherhood and a home

Much of the significance of the play lies in its unconventional and striking subject, the pregnancy of an unmarried adolescent expecting a black baby, and her platonic friendship

A novelty of production was the entry and exit of characters, dancing to music, which brought out the play's introspective and dreamlike quality The realistic film version ignored this aspect

The Lion in Love 1960 M

The *Lion in Love*, a more ambitious play taking its title from Æsop's fable, again gives an uncompromising picture of an adolescent girl's first encounter with love in a home neglected by the mother But the girl, Peg, is more mature She is concerned for others and holds off her importunate boy friend until she is sure he wants to marry her

The main interest has in fact shifted to the mother, who, unhappily married, has, like Helen, a creed of pleasure Relatives and friends who drift in and out are presented with fidelity, the dialogue being so realistic as to be flat and monotonous

The play is a shifting kaleidescope of folk in indecision and, although in some ways more mature, it lacks the compulsive central theme of *A Taste of Honey*

II EXPERIMENTAL DRAMATISTS FOLLOWING BRECHT.

Very different are those plays which show the influence of the German playwright, Brecht, for the Brechtian 'epic' play of debate discarded realism and was designed not to arouse the spectators' feelings for the characters of the play but to stimulate them to think about the social issues involved, and so to change society.

The 'epic' style, with episodic scenes, often loosely linked by a commentator or by songs, is perhaps best known in England through Brecht's masterpiece *Galileo* This study of an ambiguous 'hero' has inspired several modern English works, notably Osborne's *Luther*, Bolt's *A Man for all Seasons*, and Rattigan's *Adventure Story* and *Ross*.

The English writers who have attempted Brechtian 'epic' have tended to adopt the style of the genre, but not its political purposes Although there is no single English writer who could be called Brechtian, yet the influence is pervasive and wide-spread

John Osborne (b. 1929).

Although it was Osborne's *Look Back in Anger* that made theatre history by opening the way for the new kind of realism, yet he himself has since experimented freely with other media, his most ambitious efforts being Brechtian in style

Look Back in Anger 1956 F

The virtuosity of this play and its vigorous emotional attack on the middle-class disarmed critics inured to a vapid drawing-room comedy

It concerns a misalliance In spite of her parents' frantic opposition, Jimmy Porter, aggressively working-class in his allegiances, had married Alison, daughter of a retired Anglo-Indian colonel Although he has been to a "white-tile university," Jimmy chooses to earn his living by keeping a sweet-stall in a midland town, helped by Cliff, a self-educated and stolid young man, who also lives with the Porters

In the Porters' hum-drum bed-sitting room, an unusual milieu for a play of that date, Jimmy's fury explodes He lashes out at contemporary society "I give up Nobody thinks, nobody cares No beliefs, no convictions, and no enthusiasms" But it is soon clear that he is intent on breaking Alison's nerve by a relentless barrage of savage invective against her and her family, as representative of the middle-class

Alison's only defence is an impassive mask, behind which she is at breaking-point, for their sole contact now is physical passion, where they meet in a childish pretence of "jolly super bear," and "beautiful grey-eyed squirrel" She is now pregnant, and when Helena, her wealthy friend unexpectedly visits them, she allows her to summon the colonel and arrange her escape from an intolerable situation

Jimmy promptly takes Helena as his mistress but when Alison, having lost her baby, returns on a visit, Helena at once withdraws to leave Alison grovelling, as Jimmy had hoped she would "I want to stand up in your tears," he had cried, "and splash about in them, and sing" Alison, finally broken, Jimmy raises her up and as they resume their tenuous and unconvincing contact as squirrel and bear, the play ends

Jimmy's furious rhetoric is the play's marked characteristic and a cause of its popular success Rising to a crescendo of brutal invective when Jimmy rails at Alison and her mother, it voiced the pent-up feelings of contemporary youth, especially of the classes newly educated, now baffled by the complacency of the privileged classes, who had muddled through two wars and left them without security or direction Jimmy's marriage to Alison symbolises a rape on these classes, with all the primitive excitement that rape arouses, and the sensational replacement of one girl by another gives a further fillip

Conflict between the sexes and man's fear of matrimony is a fruitful theme, treated with subtlety by Strindberg, and wittily by Shaw, but here man's hatred of woman is a raw over-simplification, expressed in crude terms, and Alison is spoken of as the "python" which has swallowed the "rabbit"

The play is in intention satirical but Jimmy's

anger, unlike that of the great satirists, such as Swift and Shaw, is not based on any clear-headed concept of the values that should be realised in a good society It is rooted in jealousy and Jimmy's plundering of Alison's friends when he foists himself on them as unwelcome guest is symptomatic

The play's central weakness is its portrayal of character Apart from Jimmy the other figures are slightly drawn and seldom articulate Inexplicably they succumb to him, serving chiefly as targets, so that there is no convincing dramatic conflict

But the most disturbing factor is the lack of objectivity in the portrayal of Jimmy himself It is impossible to escape the conviction that he is the author's loud mouthpiece. This is unfortunate for Jimmy is immature It is true that he has suffered—boyhood grief at his father's lingering death is the core of his experience—but in his strident self-pity and destructiveness he is like the infant who screams when he can't get what he wants

Osborne's ambivalent attitude to the neurosis of the central figure disturbs many critics, but the play is a capably constructed piece, its surprises cleverly timed Its substance of social and sexual tension is expressed in terms of raw rhetoric, a melodrama of words It miraculously hit the mood of the moment, and prepared the way for new playwrights

The Entertainer. 1957. F

"Look Around and Grouse" would be a fit sub-title for this play, produced in April 1957, the year after the Suez crisis

The central figure is Archie Rice, a third-rate music-hall comedian, and the play operates on two planes Some scenes show Archie trying to hold the stage with his tawdry patter and songs in a dubious show with nudes, called "Rock'n Roll New'd Look" where Britannia is revealed wearing only her helmet Others show him at his home in a cheap sea-side lodging-house Here his wife, Phoebe, ignorant and nervy, fights depression with drink, and his father, Billy, a spruce old man, lives on memories of his own successful career in the Edwardian music-hall The incident is all off-stage and through laconic comment we learn that a son, Mick, has been shot at Suez

Osborne, in framing the realistic home scenes with the 'endistancing' device of the music-hall, is trying to break away from realism He turns to the music-hall because he believes it to be a folk art, and also because its technique "cuts across the restrictions of the so-called naturalistic stage Its contact is immediate, vital and direct "

But it is not easy to see what purpose is here served by this Brechtian 'endistancing,' for the overall mood of disillusion, 'whooped up' by drink and patter, is unquestioned and unrelieved

Luther. 1961

Luther, based on a recent biography, is Osborne's least subjective work, although he again takes for his hero a rebel, and gives heavy emphasis to the emotional rather than the intellectual sources of Luther's protests, freely selecting from Martin's own words the vocabulary of constipation, bowels, and excreta

The play has the loose epic style of Brecht's *Galileo* At the opening of each scene, the Knight "briefly barks the time and place of the scene following at the audience " The attempt is made to present Luther in an equivocal light, and the first two acts are a sympathetic portrayal of his early conflicts of conscience and the effective vigour of his attack on a corrupt Church, while in the third act he is represented as having treacherously let down the peasants who had been encouraged to rise against the Emperor But the political reasons for this situation are not even hinted at, and the audience is invited, not to debate, as in *Galileo*, but to condemn while in ingorance of the facts

This sudden volte-face breaks the back of the play which has other structural deficiencies The first two acts are much too slow and, throughout, the most effective scenes are all pure rhetoric, without a word of dialogue and directed straight at the audience Such are Tetzel's selling of indulgences, Martin's sermon at Wittenberg, his speech on his excommunication, and the incident where the Knight addresses first the audience and then the corpse of a peasant

Skilful production and the inspired acting of Albert Finney as Martin made the play theatrically very effective.

Two Plays for England. 1962

Two inconsiderable pieces, really revue sketches, and satirical in intention, have been inflated to make a double bill

The first, *The Blood of the Bambergs*, is a parody of a royal wedding Much time is consumed with mock television broadcasts and film sequences The use of film is a device revived from the German expressionistic theatre, where it was first employed by Ernst Toller in *Hurrah! We Live!*

In the second piece, *Under Plain Cover*, Tim and Jenny, a pretty provincial couple, devote their leisure to dressing up in such symbolic roles as master and maid, and to talking about knickers A thin trickle of dialogue accompanies their pallid fantasies of sex and power

In the second half, all attempt at dramatic presentation is abandoned The sensational press informs the audience that the couple are brother and sister and tells how their alliance is broken up and then resumed more furtively than before

It is interesting to compare this milk and water treatment of powerful themes with their presentation in genuine drama Incest is one theme of Middleton's *Women Beware Women*, then being revived The assuming of symbolic roles is the motif of a compelling scene in the brothel in Genet's *The Balcony*, where powerful sexual symbolism is rich with political implications

Unlike intelligent satire, these sketches neither imply positive standards, nor use the mature techniques of irony and innuendo, but rely on schoolboy mimicry In neither can we find convincing characters, action or conflict Osborne has relied on his favourite device of haranguing the audience, and very boring it can be

John Arden (b. 1930).

John Arden, who began as an architect, has proved a most original playwright, creating arresting situations, where men and women, with all their conflicting errors and aspirations, act in that initially surprising yet predictable way which is truly human

Arden does not pass judgment, nor herd folk into sheep and goats Nor, although his plays are fecund with ideas, and deal with urgent social problems, does he advocate any creed or easy solution His audience is challenged to make an individual effort to sympathise, understand, and assess It is perhaps for these reasons that his plays have not been commercially successful. But they are theatrically effective and repay close study.

Although not politically 'committed,' Arden has close affinities with Brecht, and has employed many of his techniques, but in a highly individual way, for Arden has a truly original genius.

Live Like Pigs 1959 P

On the surface level this is an objective and realistic social document about housing problems in a post-war council estate in a northern industrial town Most of the residents have been transferred from the slums of "Balaclava Row," and are basking in their newly found respectability, but the Sawneys, dragged from their insanitary caravan site, continue their unbridled predatory existence The fierce old Sawney, and his offspring, are living with the termagant Rachel, and her thieving son, Sol, and they soon make their impact on the prim Jacksons, next door

The Jacksons' only daughter is all but seduced by Sol, and Rachel does succeed in seducing Mr Jackson A further complication is the descent on the Sawneys of an even wilder group, consisting of Blackmouth, a gaolbird, who has just committed murder, his lover, Daffodil, and her batty old mother

The climax comes when Mrs Jackson rouses the women of the neighbourhood to violent attack on the Sawneys, who are saved only by the police.

Seventeen realistic scenes, fertile in incident, comic and frightening, reveal how conflicts between groups at different social levels are triggered off.

But at a deeper level the subtle, complicated personal relationships within the group are also developed, and the attractions and revulsions between the sexes and the generations are shown with accuracy and compassion

The individual scenes are presented in a Brechtian framework, most of them being prefaced by verses of the old street-ballad type, sung with a monotonous melancholy This device gives a sense of the universality of human discord to an otherwise firmly particularised place and time

Serjeant Musgrave's Dance 1959 M.

In a bleak colliery town of the 1880s, temporarily cut off by frost and snow, there arrive three Private soldiers, Sparky, Attercliffe, and Hurst, bringing heavy equipment, and led by their serjeant, Black Jack Musgrave They claim to have come recruiting, but are in fact deserters from a colonial war, held together by the dominating Musgrave

A religious man with a rigid sense of military duty, Musgrave had been horrified by the terrible reprisals taken by the British for the assassination of a comrade, Billy Hicks. He is now obsessed by one purpose only, to open men's eyes to the evil of colonial war, and "murder for greed" Believing he is God's agent, he has come to this town because Billy had been a local boy

The three Privates are uneasy as to what exactly Musgrave intends, especially Sparky, formerly Billy's close friend They are sent to sleep in the inn stable and Annie, the barmaid, who had in fact been Billy's sweetheart, visits them in their straw, and yields to Sparky's entreaties to hide him But they are overheard by the other two, and in a scuffle the gentle Attercliffe accidentally kills Sparky. Roused from a nightmare Musgrave hurries to the stable to find that the thaw has begun and the Dragoons are on the way

Musgrave hastily stages his strange revelation and appeal. In the guise of a recruiting exercise in the market place, he displays the gatling and rifles, and then, instead of a flag, hoists the skeleton of Billy The crowd fall back horrified while Musgrave describes the atrocities of the reprisals But when he claims that as five had died for Billy, twenty-five must now be killed for them, Attercliffe in dismay deliberately dissociates himself, Annie alienates the crowd by showing them Sparky's tunic, and Hurst is shot by the Dragoons, who at that moment arrive

Finally two men await execution in the prison cell, Attercliffe, heart-broken that he has killed Sparky, Musgrave, stunned that his logic and arithmetic have not worked, and that no one will remember the lesson he yearned to teach

Mrs Hitchcock, owner of the inn, visits them. Deeply disturbed by the death of Sparky, she shows Musgrave where he has erred, bringing war where they had "life and love" "I brought it to end it," Musgrave reasons, and Attercliffe replies, "To end it by its own rules no bloody good"

The play ends on a note of hope that the crowd, now dancing for joy, may one day remember

Virile incident and macabre surprises are used for a play of ideas, which enunciates no facile answer to the problem raised The texture is complex, woven of many tensions There is harsh discord between miners and colliery owner, contention between the soldiers, each of whom is strongly individualised, the discrepancy between woman's love and a soldier's careless way of life, the inner struggle that leads Musgrave to his confused and paradoxical conclusions

Mrs Hitchcock embodies the spirit of compassion implicit throughout Angry with Musgrave, it is she who gives him hope in his darkest despair, and it is symbolic that at this moment he takes drink from her hand

The dialogue of the play has a period character, and the soldiers' ballads and lyrical songs occur with complete naturalness, evoking the mood of the moment.

It is interesting to compare the scene in the market place with the last scene of Shaw's *The Devil's Disciple*.

The Happy Haven 1960 P.

This non-realistic play is set in an old peoples' home. In the form of an extended puppet show, Arden launches a good-tempered satirical fable, enlivened by a dash of magic. The characters wear masks, the set is formalised and there is even a dog, Hector, but unlike Dog Toby, Hector, although real to the persons of the drama, has to be imagined by the audience. He can be heard, but not seen!

The superintendent of the Happy Haven, Doctor Copperthwaite, although kindly and efficient, is absorbed in his research, and like a mediaeval alchemist is bent on producing Copperthwaite's Elixir of Life and Youth, intending to use his five unsuspecting patients as guinea pigs But outwitted by them, he is himself transformed into a small boy

It is remarkable that in this pantomime-like play Arden yet individualises the chief characters Old age is presented with understanding free of sentiment and its egocentric demands are expressed with ruthless frankness—

"I want to play and win every game
To live with love but not to love
The world to move but me not move
I want I want for ever and ever"

The theme of the play is childishness Copperthwaite, so absorbed in scientific research as to forget ends for means, brings it on himself The patients are already childish and the faults that may be tragic in maturity are seen as amusing foibles in old age

John Whiting (b. 1915).

Although Whiting is a playwright with original ideas, he still does not appear to have found a style that is entirely his own. His latest play shows the influence of Brecht

A Penny for a Song 1951

This, the first play of Whiting's to be produced was written at a time of great personal happiness when "the whole world seemed to be in love War appeared the greatest absurdity" Perhaps one's critical faculties are in abeyance at such a time, but the result is an agreeable whimsy, affectionately mocking at British eccentricity during the threat of an abortive invasion. The danger, so recently only too real, is given comic perspective by being thrust back to 1804

At a country house in Dorset two eccentric brothers prepare to repel Napoleon, one by actually impersonating him, the other by operating his home-made fire-engine This engine and the descent and ascent of a balloon provide the authentic period touch of gentlemanly interest in scientific invention and give the farcical idyll a dash of pantomime

Saint's Day 1951

Six months later, *Saint's Day*, which had been written at an earlier date, won the Arts Theatre award for its Festival of Britain drama competition, but its production aroused a storm of argument as to its merit

The play concerns self-destruction and the central figure is Paul Southman, now aged 83, once a famous revolutionary poet, who has gone into self-imposed exile on account of the popular outcry against his work

The play opens well Southman is a striking figure, an embodiment of the angry artist at war with society, like Swift in his aggressive scorn of compromise, his scurrilous style, and his final madness

As long as Whiting's image of Southman's isolation is endistanced it is effective, but, with the entry of the fashionable young writer, Procathren, the glossy modern world breaks in and the original image is too close to remain plausible.

Another sudden shift of viewpoint occurs when Procathren causes the violent death of Southman, his granddaughter, and her husband. A powerful central theme has been overloaded and founders in violence

Marching Song. 1954. P

In his third play, which is much concerned with the existentialist stress on the importance of choice, Whiting returns to the theme of self-destruction

The setting is the wealthy house of Catharine, "above a capital city in Europe," some years after a disastrous war, and here her former lover, Rupert Forster, formerly a general, returns after

seven years' imprisonment His crime had been to lose a decisive battle As he was occupying a vital salient, a swarm of children had suddenly surged round his tanks, impeding all progress Forster had shot the boy who was clambering over his own tank and had led his force over the children's bodies, but then, the salient taken, he had inexplicably delayed and so been defeated

On Forster's return, the Chancellor, Cadmus, seeking to forestall Forster's legal trial, requests him to commit suicide within the next thirty-six hours Forster, no longer in love with Catharine, consents

"The essence of drama is the dilemma of the central heroic figure," says Cadmus, and in the two following acts Forster examines his own dilemma This is objectified in two characters, each of whom embodies one alternative, the love of life or a soldier's honourable death

In Act II Forster talks with a young woman, Dido, who revives his sense of humanity and the will to live She may be thought of as representing what Jung calls the 'anima,' the female side of personality, and her name recalls the Dido of the *Æneid* After his talk with her Forster reverses his decision

In Act III he has a very different encounter, this time with Bruno, the Captain of the Guard that has come to take him to prison Bruno, the embodiment of military ambition and duty, represents the male aspect of personality, and to him Forster at last confesses the cause of the fatal delay He had been so overcome by compassion for the child he had shot, that "trapped by the memory" he had been unable to move Bruno stigmatises the delay as military error and guilt, and Forster commits suicide rather than endure disgrace and imprisonment

This is a strongly constructed play, its dominating theme worked out with single-minded austerity, but it lacks thrust and momentum Forster's reversal to his original decision gives it a circular movement and it is concerned to clarify judgment of the past rather than to affect the future In this it is reminiscent of *The River Line* of Charles Morgan In its acknowledgment of the discrepancy between military code and humane ethic it is highly topical and stimulating

The Devils 1962

Specially commissioned for the Royal Shakespeare Company, *The Devils* is based on Aldous Huxley's *The Devils of Loudon*, which treats of an actual case of suspected diabolism in Loudon in central France in 1617

Whiting employs two focal points One is Grandier, a priest who combines religious compassion and insight with unbridled sensuality The other is the hunchback prioress of a convent of seventeen Ursuline nuns Although she has never seen Grandier, she becomes obsessed by fantasies of his amorous adventures and the resulting hysteria, which spreads from her to the nuns, is suspected as diabolical possession, due to the evil powers of Grandier Richelieu, for political reasons, uses this as a pretext to get rid of the priest, who is tortured and burnt alive

Whiting at first 'endistances' this complex situation in Brechtian style, in brief episodes, using a 'sewer-man,' whose ironic and sceptical comments counterpoint the priest's eloquence But the Third Act is centred on Grandier's struggle to retain his religious faith and presents a spectacle of excruciating torture and degradation, which makes an emotional assault on the audience out of key with the first two acts, and aesthetically discordant

The play vividly reveals human vitality dissipated and distorted under an unnatural code of asceticism and also the terrifying ferocity that results from superstition, prejudice, and political expediency As in *A Man for All Seasons*, and *The Crucible*, we see again the courage of suffering man in refusing to recant in the face of death But here it is the 'sewer-man' who has one of the final comments, as he tells the prioress, that Grandier's bones are being prized, not as relics, but as 'charms' of love and hate

Robert Bolt (b. 1924).

The plays of Bolt show a steady advance on his early works, *The Last of the Wine*, *The Critic and the Heart*, and *The Flowering Cherry* (1957)

The Tiger and the Horse 1960.

This is a play of the conflict of ideas, the title taken from Blake's "The Tygers of wrath are wiser than the horses of instruction," and the theme is the danger of detachment This is the philosophy of Jack Dean (played by Michael Redgrave), the Master of a college, who represents the 'horse' His wife, Gwen, the 'tiger,' passionately concerned for the world's suffering, interprets Dean's detachment from her as lack of love and is becoming neurotic When Dean is averse to her signing a petition for unconditional nuclear disarmament, she develops acute hysteria, and, slashing the college Holbein, pins to it the petition Dean, then, to save his wife from complete insanity courageously identifies himself with her, thereby deserting his philosophy, and his career

The play bravely upholds the value of social idealism, threatened as it is by philosophic detachment, reinforced by the pressures of conformity It is perhaps confusing that this value should be represented by a neurotic and an oddly irresponsible young man, Louis, while Dean commands respect, but the discrepancy is thought provoking in a Brechtian way An inartistic discrepancy between the realistic academic background and the scene where Gwen's private neurosis is dragged to the light is not easy to accept

A Man for All Seasons 1960

In *The Tiger and the Horse* Bolt had tried to represent his characters as larger than life by making them unusually articulate about what they stood for, but in *A Man for All Seasons* he attempts to give them heroic dimensions by striking back into history

Believing that our great need today is a sense of personal individuality, of 'selfhood,' as portrayed by Camus, he finds an image of this in Sir Thomas More More, described by one of his contemporaries as "a man for all seasons," was not only flexibly adjusted to the renaissance society of his time, an eminent scholar and lawyer, but he also managed to preserve an inner core of unassailable integrity When suspect of a critical attitude to Henry VIII's divorce, he used all his skill in 'the thickets of the law' to prolong his life, yet he resolutely refused to swear an oath to the Act of Succession that would have released him from the Tower and the block, because for him perjury meant the loss of the soul, the self

More was, says Bolt, "a hero of selfhood" and his constancy is thrown into dramatic relief by the growing corruption of Richard Rich, whose final perjury sends More to his death

He has clear affinities with Brecht's Galileo He also is a man of supreme intelligence, whose profound inner certitude of truth is persecuted by an absolute power He also skilfully avoids open clash until it is forced upon him, and he must eventually make a final choice between astute temporising and commitment of his life to his belief The basic difference is that More comes down unequivocally on the side of constancy

Bolt uses what he calls a "bastardised version" of Brecht's style As in *Galileo* episodic scenes are strung like beads along a strong thread of intellectual argument There is also a figure, the Common Man, who acts as commentator But Bolt believes that the device of 'alienation' should be used to bring the audience back into the play and so his Common Man, with the aid of a property box, takes minor parts—steward to More and later to Rich, innkeeper, boatman, jailor, foreman of the jury, and finally henchman This quick change of costume and of rôle, also serves to throw into relief the steadfast individuality of More

Bolt, like Brecht, believes that beauty of language is a means of 'alienation' and matches fine passages from More himself with his own appropriate use of wit and imagery Images of dry land suggest society and its laws, those of water and sea the superhuman context

This is a play of quality, intellectual, literary, and theatrical, and it is concerned with urgent problems of our world today, where men are still imprisoned and executed because they refuse lip-service to an official creed The part of More was taken by Paul Scofield.

Dramatists Launched by Joan Littlewood and Theatre Workshop.—In 1953, there settled at the

Theatre Royal, at Stratford in East London, a repertory company directed by Joan Littlewood, and in the next eight years this company introduced to the public several playwrights, whose achievement was in large measure due to Joan Littlewood and her disciplined team of actors

As Joan Littlewood received only one play *They Might be Giants* by James Goldman, which she considered both lively and well-made, she looked for scripts which, however scanty or formless, had a spark of life It is spontaneity and not careful construction that is the hall-mark of those plays with which she is associated

She and her company would work together on the script until it took shape in rehearsal In some cases rambling passages were cut in others a thin outline was filled out, usually with the author's co-operation As a result it is not easy to judge how far the finished product is the work of playwright or of actors and producer

Much of Joan Littlewood's work is characterised by music-hall techniques, such as direct address to the audience, wisecracks, the lavish use of song and the entry and departure of characters to dance and music, techniques that had been employed by Brecht

Several plays were built up from the barest outline *Fings Ain't Wot They Used T' Be*, a musical play about low-life in Soho, was evolved from an 18-page script by Frank Norman Stephen Lewis's *Sparrers Can't Sing* was also largely an improvisation, as was Henry Chapman's *You Can't Always Be On Top* (1957) about workmen on a building-site

The best known of the playwrights to be launched by Joan Littlewood were Brendan Behan and Shelagh Delaney

In spite of their pseudo-Brechtian production, the plays of Shelagh Delaney are basically realistic, and have therefore already been discussed under the heading "The New Social Realism"

Brendan Behan (b 1923)

Behan, who has written his autobiography, *The Borstal Boy*, was born in Dublin, and, when still a lad, joined the I R A His activities led to two periods of imprisonment for political offences These experiences gave their substance to two unusual plays The scripts of both were sent to Joan Littlewood and considerably altered, especially in the cutting out of "chunks of terrible sentimentality" Behan co-operated by sitting in a neighbouring pub during rehearsals, pouring out words which producer and actors could prune and shape

The Quare Fellow 1956 M

Produced a fortnight later than *Look Back in Anger*, this original play attracted a similar interest

The scene is an Irish gaol during the twenty-four hours immediately preceding an execution Two murderers had been sentenced, but in the early morning the prisoners learn that one, Silvertop, has been reprieved, but "the quare fellow," who had brutally killed his own brother, is to be hanged at 8 a m the next morning

Farcical and macabre happenings succeed each other as the unnerving effect of impending violent death is shown on the different inmates Silvertop, now a 'lifer,' tries to hang himself The old lag, who swigs the meths intended as embrocation for his rheumatism, bets his Sunday bacon that there will be a reprieve The hangman, an amiable publican, works out the weight and the drop An older warder is deeply disturbed as tension mounts, and at the execution a young warder has to be carried fainting from the scaffold Meanwhile a recurring song from the punishment cell sounds a melancholy refrain

Although the play has little plot it is remarkably tense, partly because we never see the condemned man The sombre theme is presented obliquely and masked by a harsh irony of prison jests Much is also due to Joan Littlewood's skill in redistributing dialogue and tightening the structure

The Hostage. 1958. M.

Joan Littlewood was here faced with the problem of expansion, for Behan's first draft, which was in Gaelic, was only about a third of the length of the final version, and its three basic scenes had to be eked out considerably with extra characters and a sub-plot

The scene is an old Dublin house, once the refuge of I R A patriots, now a brothel An Irish boy of eighteen, now in Belfast gaol, is to be executed next morning for his political activities, and as reprisal the patriots capture a Cockney Private soldier, Leslie Williams, as hostage and bring him to the brothel as the place least likely to be reached If the Belfast boy is not reprieved, Williams is to be shot in the morning

Williams who has been brought up in a boys' home, discovers that Teresa, the gentle little Irish maid, is also an orphan, reared in a convent. Teresa tries to save Leslie, neither knowing what the strife is about But there is a raid on the house engineered as we learn at the last moment by a police spy, posing as a resident in the brothel, and in the confusion Leslie is shot

Again waiting for an execution is the basic situation but the mood is much less consistent. In *The Quare Fellow* the comic was truly integrated with the tragic, as a form of irony Here the comedy is chiefly a diversion, supplied by a host of minor characters who crowd the stage—the eccentric owner of the house, 'Monsewer,' the prostitutes, male and female, Miss Gilchrist, the half crazed old 'sociable' worker The action is constantly held up for songs, more or less satirical Other music-hall techniques are freely used, especially exchanges between comedian and 'feed,' some of them genuine Irish inconsequential humour, others, mediocre backchat and malapropisms All this pseudo-Brechtian trimming distracts from the growing alarm as Leslie begins to realise his fate, and is of doubtful value

There is touching pathos in the sequence where Leslie and Teresa each recall an orphaned childhood, and in the contrast between blunt Cockney and Irish brogue Teresa's lyric lament for Leslie runs, "He died in a strange land and at home he has no one I will never forget you, Leslie Never, till the end of time" But the mood is held only for a moment Leslie leaps up and sings "The bells of hell go ting-a-ling-a-ling," and the play ends

Behan's plays, although lacking in structure and depth of characterisation are vividly impressionistic, lively, and voluble As Kenneth Tynan says, "Language is out on a spree, ribald, dauntless, and spoiling for a fight"

Because they are presented in comic terms Behan's social convictions are fully integrated in his plays Dominic Behan describes *The Quare Fellow* as "A very fine plea against capital punishment," and *The Hostage* makes the whole business of war seem extremely childish "Maybe I'll meet that Belfast geezer on the other side," says Leslie "We can have a good laugh together then"

Two Playwrights of the Spontaneous—It is difficult to generate the feeling of immediacy and spontaneity within the confines of the firmly constructed play, but the acceptance by the public of the Brechtian type of drama, with its fluid and easy movement, has opened the way for those dramatists like Bernard Kops and Ann Jellicoe who put the highest value on spontaneity of feeling, although for very different reasons

Bernard Kops (b. 1928).

Kops was born in Stepney of Jewish parents. Leaving school at the age of thirteen, he took many jobs before becoming a writer

The Hamlet of Stepney Green 1958 P

Originally intended for Theatre Workshop, this naive play of Jewish life in the East End is based on the Hamlet story The hero, David, dreams of becoming a crooner, instead of a herring-seller, like his father, Sam Levy But Sam is dying and David overhears him muttering, "I've been poisoned—By my life or my wife But my wife was my life, so my life poisoned me, so my wife poisoned me"

Taking this to be literally true, David is eager for revenge, especially when his mother seems likely to marry the widower, Segal, and he dresses up in a black, teddy-boy version of Hamlet. But Sam, returning as a ghost, gives David a potion,

which he says is poison, but which turns out to be a love potion, infusing general good-will David at last realises that he loves the faithful Hera, Segal's daughter, and happily decides that he will croon and sell herrings at one and the same tune

This unashamed and diffuse fantasy is enlivened by the gaiety of local colour and frequent Jewish folk-song

Later plays include *Good-bye World* (1959), *Change for the Angel* (1960), *The Dream of Peter Mann* (1960,P), the one-act *Stray Cats and Empty Bottles* and *Enter Solly Gold* chosen for performance in the provinces by Centre 42

Kops is more successful with fantasy than realism and most of his plays are variations on a basic design—that of the idealistic dreamer-hero, with an uneasy relationship with his easygoing mother, who in some cases is courted by a suitor he dislikes Eventually the hero realises that a devoted girl who has long loved him is his true mate The plays thus draw nourishment from a deep emotional source, that of the Oedipus-Hamlet myth on to which is grafted the happy-ending of fairy tale

Social criticism, especially of mass produced goods, is a secondary theme

The attraction of the plays is their fairy-tale charm, their uninhibited joyousness and sense of fun, and the ease with which the rhythm of dialogue flowers into verse, song, and dance In his use of fantasy Kops is like a Jewish J M Barrie, with the significant difference that most of his heroes renounce their dreams for actuality

The artistic tension between spontaneity of feeling and excellence of form has become so relaxed that dramatic intensity is often sacrificed The plays are loosely constructed, often prolix, and the dialogue sometimes so banal as to be feeble

Ann Jellicoe (b. 1928).

Ann Jellicoe, who began as producer, has definite and unusual views as to the theatre's function Rejecting the idea of man as a rational creature and stressing the fact that people are driven by their emotions, fears, and insecurities, she attempts in her own plays to communicate with her audience not so much through the intellect as through the senses, by providing visual action, noises, and rhythm, not as loose effects but always geared to character and situation It follows from this that her plays are not concerned to enunciate a 'meaning,' which can be translated into words and 'put through' the brain, but to show something directly We should ask not, "what does this mean?" but "What is the play about?"

The Sport of My Mad Mother 1957

This, her first play, won a third prize in *The Observer* competition of 1957 It 'is about' a gang of Teddy boys, living in terror of another gang which never appears, and exulting in their feelings of violence They are joined by a young American, Caldaro, and Dodo, a child of thirteen, and are dominated by the fierce Greta As they are inarticulate, they express themselves not in sentences, but in disjointed words and phrases, staccato cries and exclamations, and incantatory, intensely rhythmic songs Flim, a commentator, emphasises these with a set of instruments, including a motor horn, which make sounds that are often discordant and arhythmic

All this makes a receptive audience aware of what it must feel like to be part of an adolescent gang, but the figures Dodo, Caldaro, and Greta are not so easy to accept Greta is a mother figure, who finally gives birth to a child and is evidently an embodiment of the Hindu goddess, Kali The epigraph of the play is, "All creation is the sport of my Mad Mother, Kali" Such symbolism, calling for an interpretation of its significance, seems out of key with a play otherwise restricted to an emotional impact

The Rising Generation

Ann Jellicoe was next commissioned to write a show for performance by Girl Guides at Wembley Pool, but although her unconventional script, "The Rising Generation" was designed to use the enormous cast and acting area to a bold theatrical effect, it was rejected.

The Knack. 1961

This play is concerned with normally intelligent people, but in the grip of the irrational emotion of sex, and the action is again carried forward, not by coherent speech but by theatrical effect

Ann Jellicoe's plays are limited in range, and in manner An image of primitive, irrational, and confused emotion is presented in such a way that the spectator is assaulted by the very emotion that is portrayed This theatrical technique certainly brings the violent feeling home to our hearts But her range is so partial as to be dangerously misleading Intellectual experience is entangled with emotional experience and just as valid an aspect of our life To dwell almost exclusively on the irrational is a dangerous preoccupation for the dramatist The neglect of coherent speech, man's hard-won tool of thought, is significant Intelligence has too often been ignored in the blind following of an emotional drive, as is witnessed by Fascism and Nazism, for us to feel complacent at its neglect

The function of the artistic image is so to reveal aspects of experience that they can be recognised and controlled For this intelligence is necessary It is inadequate to ask of a play "What is it about?" We must also ask "What is its significance, both for ourselves personally and for others?"

II. 3 PLAYWRIGHTS OF THE 'ABSURD'

Another type of theatre which discards realism and which is growing in popularity is that known as the Theatre of the Absurd, originating in Paris, and made familiar with English audiences through translations of such dramatists as Ionesco, Boris Vian, and Genet The basic concept of this theatre is the absurdity of modern existence which is revealed in images which are themselves absurd, and both sad and comic at one and the same time such as an 'audience' of empty chairs, or a young man trying to teach a collection of weighing-machines to sing the Hallelujah Chorus (*See* I17(2).)

The plays of N F Simpson are committed to techniques of this kind James Saunders claims to have been influenced by Ionesco Samuel Beckett has translated absurdity into a poetry of theatrical situation, and Harold Pinter has been influenced by Beckett

All these writers share a deep concern at the modern prostitution of language, corrupted by politicians and salesmen, and its frequent breakdown as a means of communication Many passages in their plays reveal the vapid absurdity of our everyday conversation It is partly for this reason that they have recourse to material objects or to ludicrous situations as theatrical images

Samuel Beckett (b 1906).

Beckett is an Anglo-Irishman who has made his home in France

Waiting for Godot 1955 F

This compelling and tantalising tragi-comedy, originally written in French, and produced in Paris in 1953, was later translated and performed in more than twenty countries

Character and incident are pared to the bone, and only a skeleton situation is presented At evening on a desolate road, bare but for a single tree, two wretched tramps, Vladimir and Estragon, wait for a mysterious Mr Godot As they while away the time with desultory talk and clowning, a tragi-farcical diversion is provided by the entry of Pozzo and Lucky, bullying master and wretched slave After their departure, a boy brings a message that Mr Godot cannot come but will arrive the next evening Vladimir is prepared to wait but Estragon suggests they hang themselves from the tree Vladimir makes some demur, and although they decide to go away for the night, they remain on the spot

Act II presents "Next day, same place," the only difference being, as Vladimir notices, that the tree has sprouted three or four leaves, and the basic pattern of Act I is deliberately repeated

Although like a couple of circus clowns, the

tramps are pathetically human as they waver uneasily between suicide and irrational hope. Their personalities are complementary. Estragon, who claims to have been a poet, is physically weaker, irritable, sceptical. He has dreams but a poor memory Vladimir, the more practical, is protective and less despairing Vladimir is conscious and extravert, Estragon unconscious and introvert.

An underlying affection has kept them together over fifty years The only happiness they ever express is in being together and yet they wonder if they should part "We weren't made for the same road," says Estragon

Pozzo and Lucky, another pair of contrasting characters, lack the humanity of the tramps Lucky is actually driven in by Pozzo with a rope round his neck that causes a running sore He is weighed down with luggage, carries in his mouth the whip with which he is beaten and dumbly obeys every insolent command He dances for Pozzo and even thinks for him Pozzo, loud and self-confident, greedily consumes chicken and wine while making polite conversation In their second appearance Pozzo is blind and Lucky dumb They may be considered as the personifications respectively of master and slave, worldly materialism and higher values, the physical and the intellectual, body and soul, or the two aspects of a sado-masochistic relationship

Beckett was a close friend of James Joyce, a master of symbolism, and his play as a whole is a complex dramatic symbol expressing man's anxiety and suffering as to his origin and destination This uncertainty is symbolised by the characters' confusion as to even the physical actualities of time and place But their chief uncertainty is as to the kind of man Godot is and when he will come

Some have suggested that the tramps are waiting for God But Beckett when asked what he meant by Godot said, "If I knew I should have said so in the play" An oversimplified religious interpretation is therefore inadequate

Yet the play has undoubted Christian references Beckett asked about its theme, said "There is a wonderful sentence in Saint Augustine 'Do not despair, one of the thieves was saved Do not presume, one of the thieves was damned'" "I am interested in the shape of ideas even if I do not believe in them That sentence has a wonderful shape It is the shape that matters"

Saint Augustine's balanced statement has been taken by Beckett, neither affirmed nor denied but inverted into a question, more distressing than direct denial Can we accept the existence of a divine grace that discriminates between the saved and the damned? It is a question such as this that gives its symbolic shape to the play For the basic shape is a situation of religious doubt Two outcasts are at the foot of a tree, a tree of death, which they contemplate using as a gallows, a tree of life which puts forth a few leaves

There is a recurrent questioning of relevant biblical passages The authenticity of the gospel story of the thieves on the cross is queried Pozzo answers to the names of both Abel and Cain "He's all humanity," says Estragon Godot has flocks both of sheep and goats, but he beats the boy who keeps the sheep and is kind to the brother who keeps the goats

Yet the play is much more than an expression of religious doubt Its significance is deeper, its appeal wider The anguished uncertainty of the 20th cent is whether life has any meaning whatsoever, and the play shows man suffering, lost and anxious in a universe which is losing all meaning for him

Some have considered it to be written from the viewpoint of existentialism Continuing to hope for a supernatural revelation, the tramps fail to accept the pain and disillusion of coming to terms with the nothingness at the root of our being and the need to create ourselves through the constant exercise of choice

A Jungian psychologist, Eva Metman, has made a similar interpretation in remarking, "Godot's function seems to be to keep his dependants unconscious" For a moment Vladimir does consciously face the suffering "Astride of a grave and a difficult birth. Down in the hole, lingeringly the grave digger puts on the forceps. We have time to grow old The air is full of our cries But habit is a great deadener"

Beckett's play enables us also to forego habit and to face this image of our difficulties and to find some release It has the therapeutic value of that inner knowledge advocated by Freud and Jung

It is not a play for those who cannot bear to suffer When performed in San Francisco gaol, the first play there for forty-four years, it held the audience of fourteen hundred convicts spellbound. They realised that each must find his own personal message One said, "Godot is society" Another, "He's the outside" All knew that it spoke to those who must suffer and wait.

Endgame 1958

Endgame, also translated from its French original, again depicts a static situation The selfish, materialistic Hamm, who keeps his senile and legless parents in dustbins, is now paralysed and blind, and dependent on his servant, Clov. If Clov should leave Hamm, both would die, for Hamm owns the only store of food in a devastated and dead world. Finally Clov sees outside what may be a small boy, "a potential procreator," and he prepares for departure but remains immobile

Beckett here explores the 'endgame' of death, both global and personal Since Hamm and Clov are mutually dependent, and represent complementary aspects of personality, emotion, and intellect respectively, it is possible that the total situation is an image of the dissolution of a single personality.

Krapp's Last Tape 1958 F

In the briefest sketch, Krapp, a solitary decrepit unsuccessful old man, listens to his own autobiographical tape-recording of thirty years ago, but the moment of miraculous insight it commemorates is now so meaningless to him that he switches the recording forward and broods on a description of his love-making

Beckett employs an effective device to pose contemporary queries as to the limitations of verbal communication and the continuity of personal identity

Happy Days 1962.

Here again the paralysis of later life is indicated A woman talks ceaselessly, although progressively buried in a mound of earth until it reaches her neck

Beckett's two "Mimeplays without Words" are in striking contrast to the plays in that all is conveyed in wordless action

Beckett's world is drastically limited, but it is the profoundly tragic world of Lear in the storm, and it is conceived with the intensity and the haunting power and suggestiveness of the true poet

Harold Pinter (b. 1930).

Harold Pinter, the son of a Jewish tailor in East London, first wrote poetry, and trained as a professional actor He brings to drama poetic sensibility, a genius for dramatic situation, and an unerring ear for inconsequential dialogue, especially that of working people, which is brilliantly presented

An admirer of Kafka and Beckett, he is like them most interested in men when they are "at the extreme edge of their living, where they are living pretty much alone," and he shows them holding on precariously to some tiny foothold, most frequently a room He consciously limits himself to a revelation of such periods of private anxiety, usually in a claustrophobic atmosphere, although fully aware that these are only particular moments of men's lives and not the whole

Like Kafka, he is particularly sensitive to the inscrutable forces which threaten life today, and more than any other English dramatist he has expressed the feeling of obscure menace from some vague hinterland invading the day to day setting of private life

It is appropriate that the image of menace that fascinates Pinter is that of two people in a room, while outside "there is a world bearing upon them which is frightening" In his early plays the threat is left deliberately vague and unexplained, so that an aura of mystery surrounds the area of action and sometimes violence actually

breaks through In later plays there develops a more subtle menace from within, which threatens the mind rather than the body, and there is no overt violence

In early plays especially Pinter uses a technique of mystification, whereby characters often contradict each other and themselves on trivial points of objective fact and this uncertainty may also serve to heighten the sense of insecurity To some critics this technique is irritating and it is certainly used less in later plays

Pinter, however, explicitly states that imprecision conveys a truer picture of life as we experience it "The desire for verification," he says, "is understandable but cannot always be satisfied "

It is particularly difficult to be precise about people's inner life and motive, especially if they are inarticulate "The more acute the experience, the less articulate its expression," he says

Pinter is in fact consciously disowning the rôle of the omniscient playwright, like Ibsen, who can explain everything, and is looking at his characters through the eyes of the ordinary observer, frequently puzzled by human inconsistencies

A recurring underlying theme is uncertainty as to the nature of personal identity, which is shown as enigmatic, wavering, or easily destroyed, and this theme is treated at several different levels from the mystification as to who Riley may be in *The Room*, to the tragedy of maimed personality in *The Caretaker*

Pinter's plays are like poems in their ambiguity They can be interpreted as images or allegories of experience The author however does not set out to create a symbol His work is rooted firmly in actual experience "I think it is impossible," he says, "—and certainly for me—to start writing a play from any kind of abstract idea I start writing a play from an image of a situation and a couple of characters involved, and these people always remain for me quite real "

The Room 1957

Pinter's first play, written in four days for the drama department of Bristol University, already reveals many of his characteristics

The elderly Hudds inhabit a room in a vast, strange house and when, on an icy night, Bert leaves to drive his van, Rose is nervously aware of the door, especially when a blind Negro, Riley, enters with a message from her father Bert returns and savagely kills Riley and Rose goes blind

Mystification about trivial detail is overdone here, and with the violent murder of Riley, possibly a rather crude death symbol, the play slides down into melodrama But the lit room is a vivid dramatic image of man's tiny area of warm comfort in an indifferent universe, the door a means of ingress for unknown terrors

The Dumb Waiter 1960 P

This one-acter, also written in 1957, is already a far more accomplished work

Two men, Ben and Gus, are seen in a basement bedroom in Birmingham As they talk it gradually becomes clear that they are hired assassins, taking their orders from some mysterious 'organisation' Given an address, they drive up, find the key, wait until their victim enters, shoot him, and drive off

On this occasion they are both uneasy As they argue in a desultory way about the impossibility of making themselves a cup of tea without matches, an envelope containing a few matches is pushed under the door Then the contraption of the dumb waiter (for the room had once been a kitchen) suddenly bangs down, and they are bombarded with notes demanding ever more exotic dishes, such as 'Macaroni Pastitsio' and 'Ormitha Macarounda,' and they anxiously send up what they can muster

Then they notice a speaking-tube, and as Gus goes out for a glass of water, Ben hears through this that the appointed victim is coming in straight away The door opens sharply and in stumbles Gus unarmed The two men stare at each other as the curtain falls

The play is taut with uncertainty and menace The two men, themselves killers, know practically nothing of their employers and Gus becomes increasingly suspicious of them The inexplicable intrusion of the grotesque dumb waiter, comic and frightening, assails them from this outer world, but a far more disturbing fear takes shape within the room itself

For, from the outset Gus feels a threat emanating from Ben and anxiously questions him Ben enigmatically ignores, evades, or parries all queries, reminding Gus that he is "the senior partner," and that he "took the call" The matter of fact phraseology as the killers discuss "the job" and "clearing up" uses the banalities of business jargon with telling irony

This tiny gem of a play is a microcosm of a world where treachery, fear, and suspicion surround men, invading and destroying their most intimate alliances

The Birthday Party 1958

In this, Pinter's first full-length play, the scene is again a room, this time in a shabby seaside boarding-house, kept by a kindly and inarticulate Petey, and his slatternly wife, Meg

They have one visitor only, Stanley, a man in his late thirties, waited on by Meg with stifling motherliness He claims to have been a concert pianist, but has taken refuge here for the last year, until he is suddenly unnerved by the disquieting arrival of a sinister pair, the specious Goldberg, a Jew, and the brutal McCann Like Gus and Ben, they are there 'to do a job' and their quarry is evidently Stan

It is Stan's birthday and Goldberg insists on organising a party, but first he and his accomplice subject Stan to fantastic nonsense cross examination, designed to break his nerve During the party he is blindfolded for a game and his glasses are broken by McCann Distraught he tries to strangle Meg, and as the two men converge on him, he is reduced to hysteria

Next morning the pair eventually lead him away conventionally dressed in black jacket and striped trousers, incapable of speech, his personality completely disintegrated Petey, unnerved by the two captors, can only say, broken, "Stan, don't let them tell you what to do "

The menace is sustained and intensified through three acts without overt violence and by a fine economy of indirect means, such as the breaking of glasses and blindfolding, symbolic of the destruction of vision

The fact that the identity of the three main characters is never revealed adds to the terror There are grounds for the view that Stanley, a pianist, represents the artist who is silenced and made to conform hence his conventional suit—by the pressure of society Some see him as the political refugee, some as the homosexual But in its deliberate lack of definiteness the play has a wide reference to all who seek refuge from a strange and hostile world

The Caretaker 1960 M

This play, again set in one room, has only three characters, two brothers and an old tramp, Davies

The younger, forceful brother, Mick, a successful tradesman, owns a derelict house in West London, where he lets his elder brother, Aston, have a room on the condition that he will do renovations Aston, who is slow and withdrawn, has done little beyond collecting some junk that half fills the shabby room and thinking, "I might build a shed out at the back "

One evening he brings home an old tramp, Davies, whom he has rescued from some cafe brawl He treats him with shy kindness and asks him if he would like to stay as caretaker, an offer which the tramp grudgingly accepts

Davies is completely self-regarding, and brags with the pitiful vanity of the down-and-out "I've had dinner with the best " "I've slept in plenty of beds " He is passing under the assumed name of Jenkins, but if only he could "get down to Sidcup" and collect "papers" left there fifteen years ago he could establish his identity and make his way But he never fetches the papers, just as Beckett's Krapp ignored part of his "tape" He grumbles about the draught and shows himself ungrateful, evasive, ill-tempered, prejudiced, and suspicious But Aston continues his kindness, and at last reveals himself to Davies in what is the crucial speech of the play

Haltingly, almost in a monologue, he tells how when still a youth he used to have times of extra-

ordinary quiet and lucidity, but when he talked of them people thought they were hallucinations and he was taken to a mental hospital. There he was subjected to terrifying shock treatment, and when released was prepared for death But he got better and began to do things with his hands "I feel much better now But, I don't talk to people now. I want to build that shed in the garden"

To this painful confidence Davies says not a word. Two men "at the extreme end of their living, where they are living pretty much alone" remain isolated Meanwhile the enigmatic Mick has been watching Davies, now scaring him with a pretence of violence, now leading him on by also offering him the job of caretaker

Davies believing himself secure of Mick's support becomes openly aggressive to Aston In a speech that is in fact his delayed reply to Aston's confidence he cruelly threatens and taunts him "Just you keep your place, that's all Because I can tell you your brother's got his eye on you ... They can put them pincers on your head again, man!"

Aston, finding some inner strength, replies in a quiet understatement, "I ... I ... think it's about time you found somewhere else I don't think we're hitting it off"

When Davies complains to Mick that Aston is 'nutty,' he finds himself scornfully dismissed from his 'caretaking' He returns to Aston with a final plea that is also a further encroachment, that he will take over Aston's bed But Aston resists him, and the curtain falls as he turns away to look at the site of the shed

Here is a play in a different key, showing a man actually opening the door to his fears and mastering them Aston in his long speech is facing the wrong done him by 'people,' their incomprehending destruction of his unique inner clarity of vision His vision permanently destroyed, his only creative outlet has been tinkering with his hands, but now he is trying to control his inner hurt, and to break out of his isolation by befriending another crippled human being Unhappily in turning to Davies, he meets a man so twisted by his own suffering and resentment that he can make no response

It is interesting that Pinter intended to end the play with the violent death of the tramp "It suddenly struck me that it was not necessary And I think that in this play ... I *have* developed" It is remarkable that the plight of the tramp should now seem as tragic as that of Aston

Some critics have complained that in allowing Aston to explain himself, Pinter has retreated to an old-fashioned and less effective psychological drama Others find here a moving image of the mystic and artist in man whose creative insight is destroyed by an imperceptive society, and whose only outlet is now in mechanical construction

He has certainly created two unforgettable characters and depicted their relations with disciplined compassion

A Slight Ache (1961) was originally written for radio, and *The Collection* (1962) originally written for television, is striking in its assured handling of menace and mystery in a sophisticated comedy of manners

Conclusion.—In some ways the plays of Pinter are like those of Ionesco Both playwrights have a quick ear for the clichés, non-sequiturs, and repetitions of disjointed talk Both realise the theatrical effectiveness of stage 'furniture,' like the 'dumb waiter' Both are aware of the absurdities of modern life and the way that comedy interlocks with tragedy

"Everything is funny," says Pinter, "the greatest earnestness is funny, even tragedy is funny And I think what I try to do in my plays is to get to this recognisable reality of the absurdity of what we do and how we behave and how we speak"

N. F. Simpson (b. 1919).

N. F. Simpson, an adult education lecturer, first became known as a dramatist when his play, *A Resounding Tinkle*, shared the third prize in *The Observer* competition of 1956

Simpson asked his audience to visualise a regimental sergeant-major reciting "Jabberwocky" through a megaphone, and his plays are in the peculiarly English vein of Lewis Carroll and Edward Lear, a world of nonsense, fantasy, paradox, and non-sequitur They explore the mechanical superficiality and attenuation of feeling that threaten English surburbia, and in style are remarkably like Ionesco's

A Resounding Tinkle 1957 P

This play could hardly be more self-conscious and less formal. It discards plot, progress, structure, and characterisation of dialogue. Set in the living-room of a surburban couple, it is one continuous flow of verbal paradoxes, puns, non-sequiturs, and gags

At intervals the 'author' appears, telling the audience that the play came to him in Portuguese, a language he does not know, and finally there is a parody discussion of the play by a panel of critics, who decide that it is "custard pie of the intellect" This introduction of author and critics is like that in Ionesco's *The Shepherd's Chameleon*

One Way Pendulum "A farce in a new dimension" 1959

This play concerns the suburban family of Groomkirby The son, Kirby, is first seen teaching a collection of 'Speak-your-weight' machines to sing the Hallelujah Chorus He has been successful with all but one, Gormless, which will only repeat "Fifteen stone ten pounds" His father, Arthur, "ineffectually self-important," is combining his two hobbies, of law and 'Do-it-yourself' carpentry, by building an enormous model of the Old Bailey in the living-room Here, Aunt Mildred, in a wheel-chair, imagines she is touring the Outer Hebrides, and Sylvia, the disillusioned daughter, continually grumbles about the family's eccentricities The mother phlegmatically adjusts herself to them, while actually paying a char-woman to eat up the 'left-overs'

Finally a trial takes place in the Old Bailey, and Kirby is proved guilty of murdering forty-three people in order that he may wear black, the weighing-machines being part of a complicated device to cause a holocaust of deaths

In an interview Simpson said, "In these plays each man is an island," and here the Ionesco-like absurdities of weighing-machines and Old Bailey are used to objectify the obsessions which prevent father and son from communication with each other Material things, treated with the respect due to people, are exerting a tyranny, and the intractable Gormless is now dictating Kirby's actions Inversely people are treated as things and Sylvia speaks of her aunt as "cluttering up the place ... a great old-fashioned thing in the living-room"

A further tyranny is mechanical schedule Kirby will only eat when a cash-register rings Social custom is yet another It is customary to wear black at a death, and so Kirby, to justify his preference for black, becomes a mass murderer

The anxiety, the obsession with death, the fear and guilt, and the distortion of feeling that result from a mechanical existence are finally symbolised in the trial scene, with its nightmare sequence and parody of legal formalism

These symbolic objects and motifs are novel and intriguing, and can be assigned a clear 'meaning,' but they lack the deeper significance and suggestive powers of Ionesco's Contrived rather than intuitive, they illustrate rather than illuminate the human situation *One Way Pendulum* has a coherent outline and the characters are drawn simply but consistently, each with his own 'humour' as in Ben Jonson, and the dialogue is a close parody of banal family interchange

Reactions have been varied Some find sadness here, some comedy, while others find the verbal gags too long drawn out and tiresome But this play is certainly an original experiment, provocative of thought

The Hole (1957), and *The Form* are one acters in the same style as the full-length plays

James Saunders (b. 1925).

James Saunders is a promising new dramatist. The influence of Ionesco is apparent in his satirical use of a banal dialogue, in which the characters converse without communicating, and also in the reference to some concrete symbol, which represents their anxieties or predicament.

Typical of his style are the ingenious one-acters

Alas, Poor Fred

This is sub-titled "A duologue in the style of Ionesco." Husband and wife discuss Fred, a friend who was cut in half some time ago. As tension steadily mounts, it emerges that 'Fred' is a symbol of their former passionate love. Although the situation is like that of Ionesco's *Amédée*, the play has a tension and vigour all its own.

Barnstable 1960.

Here stock character-types from the conventional drawing-room comedy of the 'thirties exchange dated clichés, all unaware that the house is collapsing around them, a symbol of the disintegration of their own comfortable way of life.

Saunders has also written the one-acters *Committal* (1960) and *Return to the City* (1960), and two full-length plays *The Ark* (1959) and *Next Time I'll Sing to You* (1963), a moving and Pirandello-like 'rehearsal' play, in the mood of an elegiac quintet exploring the theme of solitude.

David Campton (b. 1924).

Campton, who began with traditional plays, has broken new ground with "comedies of menace," brief "glimpses," or playlets. These are original, in that techniques of the Absurd, which Campton considers as "a weapon against complacency," are used, not to express unidentified menace, as in Pinter, but the actual dangers that threaten society, especially the bomb. His most notable work, which is best known in the North, is *The Lunatic View* (1957) and *A View from the Brink* (1961). Both consist of four one-acters.

II. 4. VERSE DRAMA

The last few years have also seen the attempt to revive the tradition of verse drama, the normal vehicle for the Renaissance playwright. T. S. Eliot and Christopher Fry have endeavoured to bring verse back to the stage. The superb poetry of Shakespeare's plays, kept alive in excellent revivals, still rises like the Himalayas above the contemporary scene, a constant challenge to the ambitious dramatist. But at the moment, the most successful poetic drama has not been couched in verse, but has achieved its effects through the poetry of its situation and its theatrical images. For many modern audiences it is Beckett's *Waiting for Godot* and Pinter's *The Caretaker* that have captured the poetry inherent in drama.

T. S. Eliot (b. 1888).

In his two fine plays of the 'thirties Eliot harked back to the ritualistic drama of Athens and in his three later plays he continued to use Greek themes, but presented them in terms of drawing-room comedy. It is perhaps for this reason that they lack all intensity. It has been a misalliance whose uneasiness has often embarrassed the audience.

The Cocktail Party, produced in 1949 at the Edinburgh Festival, had its source in the *Alcestis* of Euripides, but Eliot had to go into "detailed explanation" to persuade his friends that this was so. A supernatural intervention is indicated in the interviews given by the doctor, Sir Harcourt Reilly, but this breaks the back of the play. It is not possible to maintain interest in people who allow their action to be so manipulated.

The Confidential Clerk was produced in 1953, and in 1955 appeared *The Elder Statesman*, a pallid version of the *Oedipus at Colonus* of Sophocles.

The lack of intensity in these later plays would not be so damaging were it not that Eliot seems unable to animate his characters. Unlike Gerontion and Prufrock of the poems, they have no independent existence, but are flat and lifeless. Perhaps it is their impeccable social background that gives them the appearance of a group photograph in *The Tatler*. Or it may be that in an over-riding desire to indoctrinate, Eliot lines them up like factors in an argument.

The later plays of Eliot, finding their inspiration in literature rather than in actual life, are like flowers pressed between the leaves of books. It is instructive to compare them with the plays of Wesker, so deeply involved in the people he depicts.

Christopher Fry (b. 1907).

Most of Fry's plays appeared before the 'fifties. They include some highly original religious plays like *The Sleep of Prisoners* in 1951. But his especial contribution has been the expression of comedy through poetic verse and "All for your delight" might well be the epigraph of his work.

The Dark is Light Enough appeared in 1954, its theme of non-intervention is presented through the idiosyncratic Countess with an elegance and lightness which completely save the play from didacticism. Fry's most recent production is *Curtmantle*, which concerns Becket and Henry II and concentrates on the contradictory nature of Henry.

Fry devises ingenious situations in terms neither of realism nor fantasy but of romantic metaphor or fable. His verse has been compared by Allardyce Nicol to that of the youthful Shakespeare in *Love's Labour's Lost*, and Philip Hope Wallace comments on the "dancing, glancing felicity" of *Venus Observed*. The verse plays over the surface of the plays like lambent flame, a scintillating word play to delight the alert mind. It can however be a dangerous plaything, distracting attention from the dramatic issues, and perhaps for this reason Fry has used in *Curtmantle* a plainer, rougher verse and also some prose.

II. 5. THE TRADITIONAL WELL-MADE PLAY

In spite of striking innovations in the theatre, many good playwrights are still concerned with what has been called 'the well-made play.' Its salient features are a coherent plot, where the action springs from and affects the characters, and a craftsmanlike structure, with exposition, development, and dénouement, and firmly drawn characters. It can be seen in its finest modern form in the works of Ibsen, who used its finely articulated structure to both social and psychological ends. *See also* I6.

Peter Shaffer.

Five Finger Exercise 1958.

Five Finger Exercise is an example of the conventional play at its best. It is concerned with subtle relationships in a middle-class family. The people and dialogue are alive, the story coherent and gripping.

The smart wife, Louise, who is obsessed with a desire for fashionable culture and refinement, has married Stanley Harrington, a self-made furniture manufacturer. Openly despising her plebeian husband she has done her best to impose her own pattern on their son, Clive, just starting at Cambridge. Clive, intelligent and hyper-sensitive, is deeply attached to his mother, and yet realises that her pretensions to culture are meretricious, and that he is being emotionally stifled by her. At the same time he fails to make contact with the practical father.

They all come to know each other with a frightening clarity when Louise engages a young German tutor, Walter, for the fourteen-year-old daughter, Pam. He is charming and reserved, and both mother and son are drawn to him. Louise evidently hopes for a devoted cavalier, and Clive for friendly understanding. When he overhears his mother encouraging Walter, he is bewildered by a twofold jealousy, and falsely accuses the tutor to his father.

But Louise soon discovers that Walter's feeling for her is no more than filial, and furious in her hurt vanity demands of her husband that he be dismissed. Rather than face re-patriation to a

Nazi family Walter tries to kill himself and the family awaken to what they are doing only just in time

Brilliantly using the entry of an enigmatic stranger, Shaffer probes a painful and complex situation with the sensitive precision of a surgeon Meanwhile Pam, an engaging tomboy, sees it all with the unblinking gaze of innocence Her candid and refreshing comment throws the light of common sense throughout the play

A double bill produced in 1962 included

The Private Ear

This is a brief but poignant study of a boy and girl failing to make contact because they try to get through to each other on different lines

The Public Eye

Shaffer here uses a skilfully constructed high comedy, with some surprise and witty dialogue to explore again a falsity in bourgeois marriage and aesthetic values

His plays operate successfully on two levels the realistic level of personal relationship sensitively studied, and a level of ideas where he explores issues of social and artistic significance

Two predominant themes emerge first the varied strains, tragic and comic, that are felt when people with different intellectual and aesthetic interests are linked or attracted emotionally, secondly the difficulties in distinguishing between a genuine love of art and a culture pursued chiefly because it is the fashionable thing

Terence Rattigan (b. 1912).

Rattigan has long been acclaimed as a versatile and skilful playwright With a flair for witty farce and social comedy he expertly serves up a nourishing morsel in an appetising *vol-au-vent*

Becoming increasingly interested in more serious human issues, he has attempted to penetrate into suffering and pain, as in *The Browning Version* (1948), and *The Deep Blue Sea* (1952) *Variations on a Theme* (1958) was less successful, and incidentally presented a challenge to Shelagh Delaney to write her first play

Peter Ustinov (b. 1921).

Ustinov, born of a German father and a Russian mother, has long been recognised as a talented and fertile playwright, whose novel and ingenious comedies have proved more popular than his serious plays Recent productions include *The Love of Four Colonels* (1951), *The Moment of Truth* (1951), *No Sign of the Dove* (1953), *Romanoff and Juliet* (1956), and *Photo Finish* (1962)

N. C. Hunter (b. 1908).

Hunter is a competent playwright with a feeling for atmosphere, especially people's rueful acceptance of limited environment and hope deferred, but his plays lack passion, intellectual pressure, and the novelty of experiment

His successes have been *Waters of the Moon* (1951), *A Day by the Sea*, *A Touch of the Sun*, and *The Tulip Tree*, all produced with star actors

Plays by Novelists --In the 'fifties Charles Morgan, Graham Greene, Aldous Huxley, and Doris Lessing have all written competent plays in the traditional styles

Satire.--Although Shaw was a master of the craftsmanlike comedy used as a vehicle for intelligent and witty satire, he has found few successors Nigel Dennis, in *Cards of Identity* and *The Making of Moo*, is nearest to Shaw, and Giles Cooper, in *Everything in the Garden*, uses the comedy of manners to satirical effect

Nigel Dennis (b. 1912).

Nigel Dennis who began as a novelist, is a genuine satirist, a hard-hitting intellectual in the tradition of Voltaire and Shaw, and in a Shavian preface to his first two plays he wittily defines his two favourite targets. One is the doctrine of Original Sin, with expiation by faith in a blood sacrifice, as preached by Saint Augustine, the other the assumptions of psycho-analysis

Dennis decries both doctrines, arguing that they lead to self-absorption, self-abasement, the undermining of man's natural self-reliance, and a neglect of the external world. Both doctrines tend to delegate power over men's minds to a hierarchy, clerical or medical, and Dennis believes that today personal individuality and identity are threatened by both clerics and psycho-analysts

Cards of Identity 1956

This play, adapted from Dennis's own novel, is concerned to show how easy it is for the ' psychologist ' to tamper with human personality An Identity Club has been formed to give people a changed identity and three members, masquerading as Captain and Mrs Mallet and their son, Beaufort, have taken a country house, Hyde's Mortimer, where they transform unfortunate local people whom they lure to the place Giving them a new environment, and exploiting psychological techniques, such as induced hysteria, suggestion, and ' therapy,' they inveigle them into accepting changed names and a fresh set of memories, and then use them as servants

This adroit theatrical situation becomes further complicated in Act II, for the Mallets are also plotting to make the Captain president of the Club and use the occasion of a full club session at Hyde's Mortimer to carry out this plan Demonstrations of various techniques in changing identity, although wittily satirical, divert interest from the seven original characters The sensational outcome of the Mallets' plot and their victims' rediscovery, in face of their Bank Manager, of their own original personality, have to be huddled into the last few minutes of the play

In his preface Dennis reveals why he is so apprehensive of techniques of psychology, especially psycho-analysis He argues the view that man becomes conscious of his identity in virtue of his relations with certain fixed points within his scheme of things, and that the basis of personal identity is memory Thus a man's identity can be altered if his memories are edited How easy then Dennis infers, for the psychologist to manipulate his patient's memory, inject his own viewpoint, and so undermine the basis of personality! But this plausible criticism is not verified by any appeal to scientific evidence

The Making of Moo 1957

In this play Dennis satirises revealed religion, centring on a human sacrifice and giving power to a priesthood and it is clear that he has in mind not primitive religion only

The ideas implicit in this play are also developed in the preface Dennis argues that the doctrine of Original Sin leads to a reliance on ritual which re-enacts a blood sacrifice and undermines man's will to act rightly, and suggests that to conform to a sect is to create a religious Identity Club, threatening the individuality of its members

August for the People 1961

This also is satirical in aim

Dennis shows considerable dramatic talent, especially in his vigorous first acts, with their strikingly novel situation and witty and intelligent dialogue But in the middle of the play satire gets the upper hand and a demonstration of a satirical thesis tends to hold up the action and weaken the structure, as in some of the later works of Shaw

It is refreshing to see revived Shaw's practice of discussing the wider implications of ideas in a witty preface We miss, however, that luminous clarity of Shaw which threw light on so many aspects of a problem, and also the steady reference to a positive norm of conduct Dennis's preface is more one-sided and negative, and his arguments are sometimes more striking than valid, like a lively firework display, scattering broken flashes of light rather than a steady illumination.

Giles Cooper (b. 1918).

Giles Cooper's first play, *Never Get Out* (1950), was succeeded by over fifteen successful radio and television plays

Everything in the Garden 1962

A crisp comedy of situation is set in the suburbs, where a bored wife becomes a part-time employee in an exclusive brothel

The sophisticated comedy glides plausibly into an incisive satire on an effeminate bourgeois society, allowing itself to be prostituted by materialism But a sudden switch to a ritual of ruthless violence, as society exterminates the dissident husband, is too sudden a change of key to carry the audience along

The dialogue and tempo of his curious world are handled by Cooper with considerable skill

New Talent

David Rudkind. *Afore Night Come* 1962.

This play by a twenty-five-year-old Birmingham schoolmaster was highly praised by discerning critics In a Worcestershire pear orchard the fruit pickers enact the ritual murder of a freakish old tramp whom they dread as a threat to their livelihood and virility A realistic working-day world is infused with the primitive terror of *The Golden Bough.*

Fred Watson. *Infanticide in the House of Fred Ginger.* 1962

In spite of its being an ill-constructed piece, through the tacking together of two discrepant situations, this was described by a responsible critic as a "fascinating and immensely promising failure"

Gwyn Thomas. *The Keep.* 1962.

A realistic and fluent comedy of character in a South Wales home is strengthened by the sardonic twist of its surprise ending *Jackie the Jumper*, 1963, is a period play of the Chartist era, with music.

III. THE TRUE NATURE OF DRAMA

Partly through experiment the true nature of drama is being rediscovered as we remember that it is not a purely literary art "The drama," says Shaw, "was born of old from the union of two desires the desire to have a dance and the desire to hear a story" Drama is indeed an art which uses two very different kinds of material, one language, the other the presence of actual people moving on an actual stage, and the consummate dramatist knows how to deploy both literary and theatrical elements to full effect

The Greeks achieved a fine balance between the words, the literary aspect, and the movement of actors, and this balance and harmony is also characteristic of the plays of Shakespeare and his great contemporaries For Shakespeare is not only our finest poet, but also a versatile man of the theatre, who exploits to the full such diverse theatrical techniques as music and song, miming and clowning, duelling and wrestling, dance and pageantry, spectacles that until recently have been segregated in opera-house, music-hall, and circus

It was from the time of the Restoration that the delicate balance tended to be disturbed The stream of drama divided into court masque and opera on one hand, on the other, a highly literary comedy of manners depending for much of its effect on verbal wit, and an artificial tragedy of 'honour,' whose vehicle was rhetoric As the spread of printing gave permanence to the words of the play, the purely theatrical effects of the moment began to seem less important

By the 19th cent there was a real split between literary plays, like Wordsworth's *The Borderers*, which were unactable, and melodramas, like *Maria Marten* or the *Murder in the Red Barn*, which were unreadable

Although at the end of the 19th cent the great Europeans—Ibsen, Strindberg, Chekhov, Gorky, and Pirandello—infused new life into our native drama, it still remained highly literary At last it is becoming balanced It is symptomatic of a new realisation and new receptivity in the audience, that it is possible now to produce a completely wordless play like Beckett's *Mimeplay without Words*, and also his *Happy Days*, where the 'hero' appears for only a few seconds, and the 'heroine' is buried to her waist in a mound of earth. Such asceticism is not, however, necessary and the skilful dramatist knows how to employ both media to their full effect

Criteria of Judgment.—How are we to estimate the value of novel and experimental plays? The ultimate test of time is obviously impossible and some of the critical principles by which we interpret the Aristotelian drama are no longer relevant to the plays of writers like Brecht and Ionesco who deliberately repudiate traditional forms

The first canon of criticism is to remember that every art form determines the very criteria by which it is judged, and the good dramatic critic does not approach any play with a pontifical set of rules, but endeavours to keep an open mind and so discover its unique significance and value.

In 1913 Clive Bell described the visual arts as having "significant form," and the contemporary philosopher, Susanne Langer, has now developed this concept, arguing that artistic form is significant of feeling In her *Feeling and Form* she shows how each art is an indirect expression of feeling, of human response to life in all its complexity, shifting and indefinable that it can never be fully stated in terms of logical discourse but needs to be expressed in some significant artistic image The dramatist will be the greatest who makes us see and feel, not only what is going on immediately before our eyes on the stage, but beyond to the wider world and humanity in general

Our first encounter with any work of art should be in a mood of extreme receptivity, so that by shedding our preconceived notions, we may be aware of the feeling implicit in the work, however novel or even bizarre the expression may be Our initial reaction to drama should be intuitive

We can then examine the nature and quality of the feeling implicit in the play Is it true to experience, is it intense or diffuse, profound or shallow, subtle or commonplace, reasoned or irrational, genuine or perfunctory?

Questioning as to its inherent feeling often reveals that a commercially successful piece, although well constructed, is valueless, while an unconventional work, like Pinter's *The Dumb Waiter*, faithfully explores and reveals those deep-seated anxieties and fears common to us all

Drama is an especially complicated art, in that, its material being words, it also involves discussion of ideas This discussion, however, is not a tidy logical argument, but an expression of people's *feelings* about ideas, a very different thing *Chicken Soup with Barley* is not a political manifesto but a study of how one particular family *feels* about socialism.

Another enquiry concerns the appropriateness and beauty of the form in which the feeling is conveyed Many consider that Beckett's *Waiting for Godot* conveys the same mood as that implicit in *King Lear*, and that each play is an image of man, disillusioned, adrift, assailed by despair in an alien universe This recognised, the critic's task is to explore the form of the two plays They could hardly be more different *King Lear* is a Renaissance verse tragedy of the fall of princes, with subtle presentation of character development and contrast, and with a coherent plot and subplot skilfully developed through arresting action up to the tragic climax *Waiting for Godot* is a prose play about an abortive encounter, almost devoid of individual characterisation and story, with a static, circular structure, and an ending as ambiguous and inconclusive as its beginning Yet in either case the form of the play has artistic significance and appropriateness and repays close study and analysis Here again the critic needs to be a flexible interpreter of the artist's purpose

Ideally the best way to know a play is first to see it on the stage, when its theatrical qualities can be enjoyed, and later to read it at leisure, when its inner complexities and verbal felicities can be appreciated to the full

Ideas and Beliefs

An alphabetical outline of beliefs which people have held during the centuries. These are mainly religious and philosophical but the outline also includes some psychological, political, and social ideas and movements.

Ideas and Beliefs

THIS section explains many of the ideas and beliefs which people have held at different periods in history Beliefs may be true or false, meaningful or totally meaningless, regardless of the degree of conviction with which they are held Since man has been moved to action so often by his beliefs they are worth serious study The section throws a vivid light on human history

Man has always felt a deep need for emotional security, a sense of "belonging" This need has found expression in the framing of innumerable religious systems, nearly all of which have been concerned with man's relation to a divine ruling power In the past people have been accustomed to think of their own religion as true and of all others as false Latterly we have come to realise that there is common ground for all since our need in the world today is a morality whereby human beings may live together in harmony

There is also to be found in man an irresistible curiosity which demands an explanation of the world in which he finds himself This curiosity may take him into the realm of science where, by observation and reasoning based upon it, he can take part in free and unbiased enquiry in the search for truth and the acquisition of knowledge Science is a developing process and any scientist worth his salt is ready to think along new lines if fresh facts come to light Scientific ideas or concepts are dealt with in Section F.

In this dictionary the subjects fall broadly into three groups: religious, philosophical, and political It is natural that the author should hold views of his own and these may seem, occasionally, to some readers to have coloured his comments In writing about beliefs it is difficult to avoid causing some offence but the reader is assured that the writer has tried to be fair and helpful

Abecedarians, name (derived from A B C) of a small German religious sect, founded by the Anabaptist Storch in 1522, who claimed that, as knowledge of the Scriptures was communicated directly by the Holy Spirit, it was wrong to learn to read *See* **Baptists.**

Activists, those in a political movement who insist on taking active steps towards their objectives rather than merely putting forward a programme

Adoptionism, in Christianity, a doctrine advanced at various times which holds that Jesus was not born divine but, in virtue of his human spiritual achievements, was designated by God as the Son of God at the moment of his baptism in the Jordan, as told in all the four Gospels. Among the sects who held this "heretical" doctrine were the Paulicians (*q v*) The "Adoptionist" view differs from the orthodox "Conceptionist" view only in regard to the moment in the life of Jesus when the incarnation took place

Adventists, a group of American religious sects, the most familiar being the Seventh-Day Adventist Church, which observes Saturday as the true Sabbath With more than a million members throughout the world, it shares with other Adventists a belief in the imminent second coming of Christ (a doctrine fairly widespread in the U S A, during the early decades of the 19th cent when the end of the world was predicted by William Miller for 1843, then for 1844) Modern Adventists content themselves with the conviction that the "signs" of the Advent are multiplying, the "blessed event" which will solve the world's ills Believers will be saved, but the sects differ as to whether the unjust will be tortured in hell, annihilated, or merely remain asleep eternally.

Agnosticism. *See* **God and Man.**

Albigenses, also known as **Cathari** French 12th cent heretical sect (named after the town of Albi in Provence), who maintained that material things belonged to the realm of Satan and that salvation was to be achieved by crushing all animal instincts, particularly the sexual instinct, universal continence would end the domination of matter by the extinction of the human race The eating of animal flesh was forbidden and vegetarianism enjoined in order to weaken the desires Those who rigidly kept to these rules were initiated into the grade of the "Perfect", those unable fully to comply were known as the "Believers" Condemned as heretics by Pope Innocent III, the sect was finally exterminated in the Albigensian Crusade led by Simon de Montfort towards the end of the 12th cent (In his thoroughness, de Montfort also succeeded in destroying the high culture of the Troubadours) *See* **Manichaeism**

Alchemy, ancient art associated with magic and astrology in which modern chemistry has its roots The earliest mention of alchemy comes from ancient Egypt but its later practitioners attributed its origins to such varied sources as the fallen angels of the Bible, to Moses and Aaron, but most commonly to Hermes Trismegistus, often identified with the Egyptian god Thoth, whose knowledge of the divine art was handed down only to the sons of kings (cf the phrase "hermetically sealed") Its main object was the transmutation of metals Egyptian speculation concerning this reached its height during the 6th cent in the Alexandrian school Brought to Western Europe by the Moslems, one of its most famous Arab exponents was Jabir (c 760–c 815), known to the Latins as Geber, who had a laboratory at Kufa on the Tigris One school of early Greek philosophy held that there was ultimately only one elemental matter of which everything was composed Such men as Albertus Magnus (1206–80) and Roger Bacon (1214–94) assumed that, by removing impurities, this *materia prima* could be obtained Although Bacon's ideas were in many ways ahead of his time, he firmly believed in the philosopher's stone, which could turn base metals into gold, and in an elixir of life which would give eternal youth. Modern science has, of course, shown in its researches into radioactivity the possibility of transmutation of certain elements, but this phenomenon has little bearing on either the methods of the alchemist or the mysteries with which he surrounded them

Anabaptists. *See* **Baptists.**

Analytical Psychology, the name given by Carl Gustav Jung (1875–1961) of Zürich to his system of psychology which, like Adler's Individual Psychology (*q v*), took its origin from Freud's psychoanalysis (*q v.*) from which both diverged in 1911 Briefly, Jung differed from Freud (1) in believing that the latter had laid too much emphasis on the sexual drive as the basic one in man and replacing it with the concept of *libido* or life energy of which sex forms a part, (2) in his theory of types men are either extrovert or introvert (*i e* their interest is turned primarily outwards to the world or inwards to the self), and they apprehend experience in four main ways, one or other of which is predominant in any given individual—sensing, feeling, thinking, or intuiting, (3) in his belief that the individual's unconscious mind contains not only repressed material which, as Freud maintained, was too unpleasant to be allowed into awareness, but also faculties which had not been allowed to develop—*e g*, the

emotional side of the too rational man, the feminine side of the too masculine one. (4) in the importance he attaches to the existence of a collective unconscious at a still deeper level which contains traces of ancient ways of thought which mankind has inherited over the centuries These are the *archetypes* and include vague primitive notions of magic, spirits and witches, birth and death, gods, virgin mothers, resurrection, etc In the treatment of neuroses Jung believed in the importance of (*a*) the present situation which the patient refuses to face, (*b*) the bringing together of conscious and unconscious and integrating them

Jung's school of thought is undeniably not popular with scientific psychologists, but his emphasis on the more spiritual side of man's nature has brought him support from those of a religious or philosophical turn of mind, notably in the Roman Catholic Church

Anarchism, a political philosophy which holds, in the words of the American anarchist Josiah Warren (1798–1874), an early follower of Robert Owen, that "every man should be his own government, his own law, his own church" The idea that governmental interference or even the mere existence of authority is inherently bad is as old as Zeno, the Greek Stoic philosopher, who believed that compulsion perverts the normal nature of man William Godwin's *Enquiry Concerning Political Justice* (1793) was the first systematic exposition of the doctrine Godwin (father-in-law of Shelley) claimed that man is by nature sociable, co-operative, rational, and good when given the choice to act freely, that under such conditions men will form voluntary groups to work in complete social harmony Such groups or communities would be based on equality of income, no state control, no property, this state of affairs would be brought about by rational discussion and persuasion rather than by revolution

The French economist Proudhon (1809–65) was the first to bring anarchism to the status of a mass movement In his book *What is Property?* he stated bluntly that "property is theft" and "governments are the scourge of God" He urged the formation of co-operative credit banks where money could be had without interest and goods could be exchanged at cost value at a rate representing the hours of work needed to produce each commodity Like Godwin, he disapproved of violence but, unlike Marx, disapproved of trades unions as representing organised groups

In communistic anarchism these ideas were combined with a revolutionary philosophy, primarily by the Russians Michael Bakunin (1814–76) and Peter Kropotkin (1842–1921) who favoured training workers in the technique of "direct action" to overthrow the state by all possible means, including political assassination In 1868 anarchists joined the First International which broke up a few years later after a bitter struggle between Bakuninists and Marxists Subsequently small anarchist groups murdered such political figures as Tsar Alexander II of Russia, King Humbert of Italy, Presidents Carnot of France and MacKinley of America, and the Empress Elizabeth of Austria

Anarchism and communism differ in three main ways (1) anarchism forms no political party, rejects all relationship with established authority, and regards democratic reform as a setback; (2) communism is against capitalism, anarchism against the state as such, (3) both have the final goal of a classless society, but anarchism rejects the idea of an intermediate period of socialist state control accepted by communism. Philosophical anarchists, such as the American writer Henry David Thoreau (1817–62), were primarily individualists who believed in a return to nature, the non-payment of taxes, and passive resistance to state control, in these respects Thoreau strongly influenced Ghandi as did the Christian anarchist Tolstoy *See also* **Syndicalism**

Anglicanism, adherence to the doctrine and discipline of the Anglican, as the genuine representative of the Catholic Church. *See* **Church of England**

Anglo-Catholicism. To Queen Elizabeth I the Church of England was that of the "middle way" in which human reason and commonsense took their place beside Scripture and Church authority. The extent to which these various factors are stressed creates the distinctions between "high" and "low" church Anglo-Catholics tend to reject the term "Protestant" and stress the term "Catholic" and, although few accept the infallibility of the Pope, some Anglo-Catholic churches have introduced much or all of the Roman ritual and teach Roman dogmas It would appear that Anglo-Catholicism is on the increase. *See* **Catholicism**, **Tractarianism**.

Animatism, a stage in primitive religion in which life is attributed to inanimate objects

Animism (see above) is a more advanced stage in which it is believed that natural objects may be the *abodes* of souls or spirits

Anthropomorphism, the ascription of human physical and moral qualities to God or gods (in psychology to gods or animals) Psychologists use the term *Anthropopathy* for the ascription of such qualities specifically to the Deity

Anticlericalism, resentment of priestly powers and privileges, traceable in England to Wyclif's insistence in the 14th cent on the right of all men to have access to the Scriptures The translation of the Bible into the common tongue was a great landmark in the history of the Bible and the English language Wyclif's principles were condemned by the Roman Church of his time but were readily accepted during the Reformation Tudor anticlericalism arose from motives ranging from a greedy desire to plunder the riches of the Church to a genuine dislike of the powers of the priesthood whose spiritual courts still had the right to decide on points of doctrine or morals in an age when the layman felt he was well able to decide for himself In innumerable ways the Church was permitted to extort money from the laity It is generally agreed, says Trevelyan, that the final submission of church to state in England was motivated quite as much by anticlericalism as by Protestantism The rise of the Reformed churches in England satisfied the people generally and anticlericalism never became the fixed principle of permanent parties as happened in France and Italy from the time of Voltaire onwards

Antisemitism, a term first applied about the middle of the last century to those who were anti-Jewish in their outlook. Although this attitude was prevalent for religious reasons throughout the Middle Ages, modern antisemitism differed (*a*) in being largely motivated by economic or political conditions, and (*b*) in being doctrinaire with a pseudo-scientific rationale presented by such men as Gobineau (1816–82) and Houston Stewart Chamberlain (1855–1927), and later by the Nazi and Fascist "philosophers" Beginning in Russia and Hungary with the pogroms of 1882 it gradually spread south and westwards where, in France, the Dreyfus case provided an unsavoury example in 1894 Thousands of Jews from Eastern Europe fled to Britain and America during this period, for in these countries antisemitism has rarely been more than a personal eccentricity During the last war the murder of six million Jews by the Nazis and their accomplices led to a further exodus to various parts of the world and finally to the creation of the state of Israel

The individual Jew-hater makes unconscious use of the psychological processes of projection and displacement: his greed or sexual guilt is projected on to the Jew (or Negro or Catholic) because he cannot bear to accept them as his own emotions, and his sense of failure in life is blamed on his chosen scapegoat rather than on his own inadequacy

But there are social causes too and politicians in some lands are well versed in the technique of blaming unsatisfactory conditions (which they themselves may have in part produced) upon minority groups and persuading others to do the same Historically, the Jew is ideally suited for this role of scapegoat: (1) in the Middle Ages when usury was forbidden to Christians but not to Jews, the latter often became moneylenders incurring the opprobrium generally associated with this trade (*e g.*, to the

simple-minded Russian peasant the Jew often represented, not only the "Christ-killer," but also the moneylender or small shopkeeper to whom he owed money); (2) many trades being closed to Jews, it was natural that they concentrated in others, thus arousing suspicions of "influence" (i.e. Jews are felt to occupy a place in certain trades and professions which far exceeds their numerical proportion to the population as a whole); (3) even with the ending of ghetto life, Jews often occupy *en masse* some parts of cities rather than others and this may lead to resentment on the part of the original inhabitants who begin to feel themselves dispossessed, (4) Jews tend to form a closed society and incur the suspicions attached to all closed societies within which social contacts are largely limited to members, marriage outside the group is forbidden or strongly disapproved of, and the preservation, among the orthodox, of cultural and religious barriers tends to isolate them from their fellow citizens. Discrimination, hateful as it is, does not come from one side only and it is such barriers as these that help to maintain an old and cruel folly. *See* **Racism, Zionism, Judaism.**

Antivivisection, opposition to scientific experimentation upon live animals based, according to its supporters, both on the moral grounds of the suffering imposed, and on the less secure claim that many doctors and scientists of repute have rejected the value of information gained in this way. It is true that the protagonists of the movement during its early days in the mid-19th cent. included a number of eminent physicians and surgeons, but few today—whatever their moral scruples—would deny the value of the results obtained. The Animal Defence and Anti-vivisection Society (one of the half-dozen or more in Britain) claims to have co-ordinated medical opposition by "the foundation of various associated medical bodies and the publication of numerous articles by members of the profession whilst at the same time drawing attention to methods of prevention and cure of disease not associated with animal experimentation." These include such methods as homeopathy, nature cure, herbalism, physiotherapy, hydrotherapy, and psychotherapy of which it would be not unfair to say that the first three are long outdated and the last three are merely auxiliary methods of treatment in specific diseases. Without animal experiments we should be without vaccines, sera, or antitoxins against smallpox, tetanus, typhoid, diphtheria, poliomyelitis, and a multitude of other diseases, we should have no detailed knowledge about vitamins, or about the effects of radioactive fall-out; we would be unable to test out new drugs for safety before using them on human beings. Animal experimentation is controlled by the Cruelty of Animals Act of 1876 which makes obligatory the possession of licences by experimenters, inspection of laboratories by the Home Office, and the issue of annual returns of experiments.

Apartheid, an Afrikaans word (lit. "apart-hood") referring to the policy of total racial discrimination between Black and White South Africans—the permanent inhabitants of the country—as enforced by the National Party which came into power in 1948. Some degree of segregation has existed in South Africa since the earliest days of colonialism in the mid-17th cent., and the policy was continued by the United Party under Smuts and Hertzog from 1934 onwards. But the measures introduced by the National Party under Malan, Strydom, and now Verwoerd have affected every aspect of the lives of the non-Whites. Apartheid involves the beliefs in racial purity and *baaskap* or White supremacy although it is frequently stated that the ideal is that the races should be given equal but separate opportunities. Laws affect the rights of movement and the political rights of the non-Whites (in 1953 it was made a crime for a native worker to start or participate in a strike). Responsibility for native education has been transferred to the Minister for Native Affairs who has stated that teachers who believe in racial equality would be held "undesirable." The policy of the National Party has been to end native representation in parliament, to set up separate schools and universities and to prevent tribal natives from entering towns other than temporarily. Natives have no free choice over where they shall live, what occupation they shall follow, nor do they have ordinary rights in respect of property or marriage. The same regulations apply to the Cape Coloured. Sexual relations between White and non-White are forbidden by the Immorality Act which also forbids any "invitation" to such behaviour. Apartheid has been condemned by the General Assembly of the United Nations, in April 1961 in stronger terms than ever before. A resolution passed on that day deplored South Africa's total disregard of the U.N.'s repeated representations and its aggravation of racial issues by further discriminatory measures, deprecated policies based on racial discrimination as repugnant to human dignity, and described Apartheid as a flagrant violation of the U.N. Charter and the Declaration of Human Rights. A more extreme resolution was passed in November 1962 when the Assembly called for sanctions against South Africa. It was on the issue of racial discrimination that South Africa withdrew from the Commonwealth in May 1961. *See also* **Racism.**

Arianism, formed the subject of the first great controversy within the Christian Church over the doctrine of Arius of Alexandria (d. 336) who denied the divinity of Christ. The doctrine, although at first influential, was condemned at the Council of Nicaea (325), called by the Emperor Constantine, at which Arius was opposed by Athanasius, also of Alexandria, who maintained the now orthodox view that the Son is of one substance with the Father. Arius was banished and the heresy had died out by the end of the 4th cent., but disbelief in the divinity of Christ has formed part of the doctrine of many minor sects since, notably in **Unitarianism** (*q.v.*).

Arminianism, the doctrine of Jacobus Arminius or Jakob Harmensen (1560–1609), the Dutch minister of a Protestant church in Amsterdam, who had trained in the universities of Leyden and Geneva where he learned the Calvinistic doctrine of predestination (*See* **Calvinism**). Later he became deeply convinced of the falsity of this belief which maintained that God had, by an eternal decree, predestined which people were to be saved and which eternally damned. In face of the bitter opposition of his opponent Franz Gomar and his party who held this view, Arminius asserted that God bestows forgiveness and eternal life on all who repent and believe in Christ. In England a modified Arminianism was later to become the theology of Wesleyan Methodism.

Assassins, a sect of Moslem Shi'ites, founded by the Persian Hasan i Sabbah (*c.* 1090), which for more than two centuries established a rule of terror all over Persia and Syria. The coming of the Mongols in 1256 destroyed them in Persia and the Syrian branch suffered a similar fate at the hands of the then Mamluk sultan of Egypt, *c.* 1270. It was a secret order, ruled over by a grand master, under whom the members were strictly organised into classes, according to the degree of initiation into the secrets of the order. The devotees, belonging to one of the lower groups, carried out the actual assassinations under strict laws of obedience, and total ignorance of the objects and ritual of the society. It is believed that the latter were given ecstatic visions under the influence of hashish, whence the term *hashshashin*, which became corrupted to "assassin."

Association. In psychology, the Associationist school of the 19th cent. accepted the association of ideas as the fundamental principle in mental life. It was represented in Britain by the two Mills and Herbert Spencer, in Germany by J. F. Herbart (1776–1841). To these, mental activity was nothing but the association of "ideas" conceived of as units of both thought and feeling—the emotion of anger or the perception of a chair were both "ideas"—and apart from them the self did not exist. Personality was simply a series of these units coming and going, adding to or cancelling each other out, in accordance with rigid and mechanistic scientific laws.

Assumption of the Virgin. The Roman Catholic

belief, that the Blessed Virgin ascended bodily to heaven after her death, was proclaimed by Pope Pius XII towards the end of 1950. It is now, therefore, binding on all Catholics under pain of anathema and the guilt of mortal sin. Protestants are liable to make the mistake of supposing that such dogmas are new additions to the faith invented by the pope of the moment. According to Catholic doctrine, no addition can be made to the "faith once delivered to the saints," and every dogma is justified by reference to Bible texts and the traditions of the Church. Both Eastern and Western Churches have been permitted to believe in the Assumption of the Virgin for over a thousand years, and the new dogma merely clarifies the old belief and makes it binding on the faithful.

Astrology, a pseudo-science bearing much the same historical relationship to astronomy as alchemy did to chemistry. Originally it was divided into the two branches of Natural Astrology which dealt with the movements of the heavenly bodies and their calculation, and Judicial Astrology which studied the alleged influence of the stars and planets on human life and fate. It was the former that developed into modern astronomy, the latter was, and remains, sheer superstition.

Astrology owes most to the early Babylonians (or Chaldeans) who, being largely nomadic in an environment which permitted an unobstructed view of the sky, readily accepted the idea that divine energy is manifested in the movements of the sun and planets. Gradually this concept became enlarged and the relative positions of the planets both in relation to each other and to the fixed stars became important together with the idea of omens, that, if a particular event occurred whilst the planets were in a particular position, the recurrence of that position heralded a recurrence of the same sort of event. Soon the planets became associated with almost every aspect of human life. They were bound up with the emotions, with parts of the body, so that astrology played quite a large part in medicine up to late mediaeval times. Not only was the position of the planet to be considered but also the particular sign of the zodiac (or house of heaven) it was occupying, and it was believed possible to foretell the destiny of an individual by calculating which star was in the ascendant (*i.e.* the sign of the zodiac nearest the eastern horizon and the star which arose at that precise moment) at the time of his birth. Astrology was popular among the Egyptians, the Romans (whose authorities found the Chaldean astrologers a nuisance and expelled them from time to time), and during the Middle Ages when astrologers were often highly respected. Because of people's innate desire to see into the future there are, alas, still astrologers about to exploit ignorance.

Atheism. *See* **God and Man.**

Atomism. (1) in philosophy, the atomists were a group of early Greek thinkers, the most important of whom were Leucippus (*fl. c.* 440 B.C.) and his younger contemporary Democritus (*c.* 460–370 B.C.). Prior to these men, although it had been agreed that matter must be composed of tiny ultimate particles and that change must be due to the manner in which these mingled or separated from each other, it was supposed that there existed different types of particle for each material—*e.g.* for flesh, wood, hair, bone. The atomists taught that atoms were all made of a single substance and differed only in the connections (pictured as hooks, grooves, points, etc.) which enabled them to join each other in characteristic ways. Theirs was the first move towards modern atomic theory and a predecessor of the modern concept of chemical linkages. (2) in psychology, atomism refers to any theory which holds that mental states can be analysed without loss into elementary units, *e.g.* **Associationism** and **Behaviourism** (*q.v.*).

Authoritarianism, a dictatorial form of government as contrasted with a democratic one based on popular sovereignty. Its alleged advantages are the avoidance of the delays and inefficiency said to be characteristic of the latter, but like "Bolshevism" the word is used today mainly as a form of abuse.

B

Baconian Method, the use in science and philosophy of the inductive (as opposed to the deductive or Aristotelian) method of reasoning as proposed by Francis Bacon (1561–1626). Deduction argues from supposedly certain first principles (such as the existence of God or Descartes's "I think, therefore I am") what the nature of the universe and its laws *must* be, whereas Bacon denied the possibility of proving religious or metaphysical doctrines by thought and argument. The only means of obtaining true knowledge of the universe, in his view, was by the amassing of facts and observations so that when enough were obtained the truth would be known in the same way that a child's numbered dots in a playbook joined together by a pencilled line create a picture. This method, known as induction, is essentially the method of modern science, although it is generally agreed today that Bacon underrated the importance of hypothesis and theory since the greatest possible number of observations are of little significance until the scientist's intuition makes sense of them.

Baptists, a Christian denomination whose distinctive doctrines are that members can only be received by baptism "upon the confession of their faith and sins" and that "baptism in no wise appertaineth to infants." Baptism is therefore by total immersion of adults. Modern Baptists base their doctrines upon the teaching of the Apostles and some hold that the **Albigenses** (*q.v.*) maintained the true belief through what they regard as the corruption of the Roman Church in mediaeval times. On the other hand any connection with the Anabaptist movement during the Reformation is rejected and the beginning of the modern Church is traced to John Smyth, a minister of the Church of England who in Amsterdam came under the influence of the Arminians (*q.v.*) and Mennonites. Smyth died in 1612 when the first Baptist church in England was built at Newgate. This, the "General" Baptist Church, rejected Calvinistic beliefs and held the Arminian doctrine of redemption open to all, but some years later a split occurred with the formation of the "Particular" Baptist Church which was Calvinist in doctrine. In 1891 the two bodies were united in the Baptist Union and today the sect is spread throughout the world, notably in the U.S.A.

The **Anabaptist** movements of Germany, Switzerland, and Holland also practised adult baptism in addition to a primitive communism and demanded social reforms. Persecuted by both Catholics and Protestants, their leader, Thomas Münzer, and many others were burned at the stake (1525). However, this sect was noted for its violence under a religious guise, and its taking over of the state of Münster in 1533 was characterised by wild licentiousness, since, as Antinomians, they believed that the "elect" could do no wrong. A revival begun by Menno Simons (d. 1561), a Dutch religious reformer, led to the formation of the Mennonite sect which, whilst rejecting infant baptism, gave up the objectionable features of the Anabaptists. This reformed sect still exists as small agricultural groups in the original strongholds of the movement and in the United States.

Beat Generation, a term first used by the American writer Jack Kerouac in his novel *The Town and the City* to define various groups spread across the face of the country, but notably New York and San Francisco, which, belonging to the post-war generation, represented a complex of attitudes. Briefly, these are: rejection of the values of the past and lack of conviction in the possibility of a future for humanity—hence an acceptance of nothing but the immediate present in terms of experience and sensations; rebellion against organised authority, not out of any political conviction (as in the case of anarchism), but rather from lack of any interest or desire to control events, nature, or people; contempt for the "Square"—the orthodox individual who, stuck firmly in his rut, "plays it safe" and remains confident of the rightness and decency of his moral values. The "Beatnik" has con-

tracted out of what one of them describes as "an increasingly meaningless rat-race rigged up by and for Squares" which wastes effort and brutalises feeling He loathes the pretences without which, he claims, the Square cannot succeed, and throwing off all masks is indifferent to the opinions of others, his dress, or the need to work, thus entering into "the inescapable truth and squalor of his own being" He "digs" (likes) everything, tries everything from drugs to sexual relationships, which have no significance outside the sensations of the moment to the advanced Beatnik or "hipster" All men are addressed as "man," all women as "chick" Of course, the above is an intellectualisation by such Beat writers as Kerouac, Allen Ginsberg, and Carl Solomon or Norman Mailer of a philosophy which for many Beatniks would be meaningless, being satisfied with any excuse for their own exhibitionism, sexual promiscuity, and psychopathic tendencies Beards (in men), bare feet, sloppy clothes, and unwashed bodies are the familiar Beatnik uniform of today

Beatniks exist in many European countries and are not to be confused with the British "Angry Young Man" who shares with them nothing but the qualities of belonging to the post-war generation and their rejection of certain features of modern society. Instead of creating his own world of fantasy, the Angry Young Man wants his right of entry into the real world where careers are made and ambitions realised Such writers as John Wain, Kingsley Amis, John Osborne, and Colin Wilson are men who, unlike the Beatnik, still *care*—they speak for the working-class or lower middle-class intellectual with a red-brick education who finds that even in the Welfare State the "Establishment" and class still count

Behaviourism, a school of psychology founded in 1914 by Dr John B Watson, an animal psychologist at Johns Hopkins University, Baltimore Its main tenet was that the method of introspection and the study of mental states were unscientific and should be replaced by the study of behaviour When animals or human beings were exposed to specific stimuli and their responses objectively recorded, or when the development of a child, as seen in its changing behaviour, was noted, these alone were methods which were truly scientific Watson contributed an important idea to psychology and did a great deal towards ridding it of the largely philosophical speculations of the past But he also went to absurd extremes, as in his view that thought is nothing but subvocal speech, consisting of almost imperceptible movements of the tongue, throat, and larynx (*i e*, when we think, we are really talking to ourselves), and his further opinion that heredity is, except in grossly abnormal cases, of no importance He claimed that by "conditioning," the ordinary individual could be made into any desired type, regardless of his or her inheritance

The work of Ivan Pavlov had begun about 1901, but was unknown in America until about ten years later, and it was through another Russian, Vladimir Bekhterev, that the concept of "conditioning" was introduced into the country Bekhterev's book *Objective Psychology*, describing his new science of "reflexology," was translated in 1913 and played a great part in the development of Behaviourist ideas The conditioned reflex became central to Watson's theory of learning and habit formation (*e g*, he showed that a year-old child, at first unafraid of white rats, became afraid of them when they came to be associated with a loud noise behind the head) Finally all behaviour, including abnormal behaviour, came to be explained in terms of conditioned responses, these were built up by association on the infant's three innate emotions of fear, rage, and love, of which the original stimuli were, for the first, loud noises and the fear of falling, for the second, interference with freedom of movement, and for the third, patting and stroking. The Behaviourist method is widely used all over the world as a technique in psychological research, but in the Western world there remain few Behaviourists of the out-and-out Watsonian type. The work of Freud has made it impossible to ignore the importance of introspection in psychology.

Benthamism. *See* **Utilitarianism.**

Bolshevism, an alternative name for **Communism** (*q v*), usually used in the West in a derogatory sense When the Russian Social Democratic Party at a conference held in London in 1903 split over the issue of radicalism or moderation, it was the radical faction headed by Lenin (who subsequently led the 1917 Revolution and became first Head of State of the Soviet Union) which polled the majority of votes. The Russian for majority is *bolshinstvo* and for minority *menshinstvo*, hence the radicals became known as Bolsheviki and the moderates as Mensheviki, anglicised as Bolsheviks and Mensheviks *See* **Communism, Marxism**

British Israelites, a religious group who hold the race-theory that the English-speaking peoples (of the White Race) are the lineal descendants of the "lost Ten Tribes" of Israel (deported by Sargon of Assyria on the fall of Samaria in 721 B C) They believe the Anglo-Saxons to be God's "Chosen People" in the literal sense of the term as it is used in the Old Testament, by whom the world will be brought in readiness for the Millennium The official organisation is the British-Israel World Federation of which the official journal is the *National Message* Some British Israelites have the notion that the future can be foretold by the measurements of the Great Pyramid Richard Brothers (1757 1824), the "nephew of the Almighty," is generally regarded as the founder of the modern British-Israelite movement

Buddhism, one of the great Oriental religions It arose against the background of Hinduism in north India in the 6th cent B C, its founder (real or legendary) being the Hindu prince Siddhartha or Gautama, known as the Buddha or "Enlightened One" Distressed by the problem of human suffering from which even death allowed no escape—since Buddha accepted the Hindu doctrine of a cycle of lives—he left his palace and his beloved wife and child to become a religious mendicant and ascetic, studying without success for six years the beliefs of both Brahmans and self-torturing fakirs Then, after being tempted to give up his quest by Mara, the Prince of Darkness, he sat down under a tree (the Bo-tree) and finally came to understand the cause and cure of suffering The result of his meditations are enshrined in the "four noble truths" which are (1) that existence is unhappiness, (2) that unhappiness is caused by selfish desire or craving, (3) that desire can be destroyed, (4) that it can be destroyed by following the "noble eightfold path" whose steps are, right doctrine, right purpose, right speech, right conduct, right lowliness, right purity, right thought, and right concentration The more man acquires merit by following these rules in his chain of lives, the sooner is *Nirvana* attained, he loses his individuality, not by annihilation, but "as the dewdrop slips into the shining sea," by merging with the universal life

Buddhism therefore preaches freedom from attachment and the law of *karma*—that a man's actions control his destiny after death as inevitably as cause follows effect, so that his future is solely in his own keeping. A universal God plays no part in this religion, and in many Buddhist nations no word exists for the concept which was neither affirmed nor denied by Buddha himself but simply ignored. Nor did Buddha claim to be other than a man, although much superstition entered the religion at a later date prayers were made to Buddha, ritual developed, sacred relics preserved under stupas, and the belief in a succession of Buddhas introduced, the sacred writings (*Tipitaka*) are divided into three parts, for the layman, the monks, the philosophers They were produced by devotees at three councils—the first held immediately after the death of Buddha at the age of 80, the last at the order of King Asoka in 244 B C. The founder himself wrote nothing

Buddhism is a missionary religion and spread to Ceylon, Nepal, Tibet, Mongolia, Indo-China, Burma, Siam, China, and Japan, although on the whole losing influence in India In Tibet, Buddhism developed into Lamaism (*q.v*). In Ceylon and Burma it persisted in its pure form (the Hinayana), while in China and

Japan it developed into the Mahayana with its bodhisattvas and avatars. Sects developed, one of the most important being the Chinese **Ch'an** (Japanese **Zen**) **Buddhism** (*q v*). Outside Asia there are active movements in many Western countries where the serenity and rational humanism of Buddhism appeals to intellectuals as diverse as staid humanists and eccentric beatniks.

Bushido, the traditional code of honour of the Samurai or Japanese military caste corresponding to the European concept of knighthood and chivalry with which it took its separate origin in the 12th cent. Even today it is a potent influence among the upper classes, being based on the principles of simplicity, honesty, courage, and justice which together form a man's idea of personal honour. *Bushido* was strongly influenced by **Zen Buddhism** (*q v*).

Calvinism, the branch of Protestantism founded basically (although preceded by Zwingli and others) by Jean Chauvin (1509–64), who was born in Noyon in Picardy. John Calvin, as he is usually called, from the Latin form of his name, Calvinus, provided in his *Institutions of the Christian Religion* the first logical definition and justification of Protestantism, thus becoming the intellectual leader of the Reformation as the older Martin Luther was its emotional instigator. The distinctive doctrine of Calvinism is its dogma of predestination which states that God has unalterably destined some souls to salvation to whom "efficacious grace and the gift of perseverance" is granted and others to eternal damnation. Calvinism, as defined in the Westminster Confession, is established in the Reformed or Presbyterian churches of France, Holland, Scotland, etc., as contrasted with the Lutheran churches, and its harsh but logical beliefs inspired the French Huguenots, the Dutch in their fight against Spanish Catholic domination, and the English Puritans. The rule set up under Calvin's influence in Geneva was marred by the burning at the stake of the anatomist Servetus for the heresy of "pantheism," or, as we should say, Unitarianism.

Perhaps its greatest single influence outside the Church was the result of Calvinist belief that to labour industriously was one of God's commands. This changed the mediaeval notions of the blessedness of poverty and the wickedness of usury, proclaimed that men should shun luxury and be thrifty, yet implied that financial success was a mark of God's favour. In this way it was related to the rise of capitalism either as cause or effect. Max Weber, the German sociologist, believed that Calvinism was a powerful incentive to, or even cause of, the rise of capitalism (*q v*), Marx, Sombart, and in England, Tawney, have asserted the reverse view—that Calvinism was a result of developing capitalism, being its ideological justification.

Capitalism is an economic system under which the means of production and distribution are owned by a relatively small section of society which runs them at its own discretion for private profit. There exists, on the other hand, a propertyless class of those who exist by the sale of their labour power. Capitalism arose towards the end of the 18th cent in England where the early factory owners working with small-scale units naturally approved of free enterprise and free trade. But free enterprise has no necessary connection with capitalism, by the beginning of this century monopolies were developing and state protection against foreign competition was demanded. Capitalism is opposed by those who believe in **socialism** (*q v*), first, for the moral reasons that it leads to economic inequality and the exploitation of labour and the consuming public, and that public welfare rather than private profit should motivate the economic system, secondly, for the practical reason that capitalism leads to recurrent economic crises. Defenders of the system, however, maintain that it conduces to efficient production by providing the strongest incentive to enterprise and good service.

Catholicism. For those who are not Roman Catholics the term "Catholic" has two separate meanings. The more general refers to the whole body of Christians throughout the world, the more specific refers to a particular view of Christianity. In this latter sense the Church of England, the Orthodox Eastern Churches, and others consider themselves "Catholic" meaning that (*a*) they belong to Christ's Church as organised on an accepted basis of faith and order, (*b*) they insist on the necessity of "liturgical" worship through established forms (*e g*, baptism, holy communion), (*c*) they emphasise the continuity of Christian tradition by the use of ancient creeds (*e g*, the Apostles' Creed, the Nicene Creed) and regard the ministry as a succession (Apostolic succession) deriving from early practice. In this sense there is thought to be no necessary contradiction between Catholicism and Protestantism regarded as a renewal of the Church in the 16th cent by an appeal to the Scriptures as interpreted by the early Fathers of the Church. This definition obviously excludes Quakers, Christian Scientists, and many Nonconformist sects.

The Roman Catholic Church is the religious organization of all those who acknowledge the bishop of Rome as head of the Christian Church, recognizing him as the lawful successor of St Peter, who was the apostle appointed by Christ to be the head of the Church. Whereas in the Protestant Churches prayer and preaching play a central part (each individual soul seeking direct communication with God), in Roman Catholic worship the central service is the Mass, or Holy Eucharist, the seven sacraments (baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage) being administered by a special priesthood. Church discipline and organisation are strong and authoritarian. *See* **Papal Infallibility**.

Catholic Apostolic Church, a body of Christians which originated in England *c* 1831, founded on the teaching of Edward Irving (d 1834). They disapprove of the term "Irvingites" by which they are sometimes known. The common doctrines of Christianity are accepted, symbolism and mystery characterise the elaborate liturgy, and lights and incense are used.

Characterology, the attempt made over many centuries to classify people into personality types on the basis of physical or psychological characteristics. The first attempt was made by Hippocrates in the 5th cent B C who classified temperaments into the *sanguine* (or optimistic), the *melancholic*, the *choleric* (or aggressive), and the *phlegmatic* (or placid), these were supposed to result from the predominance of the following "humours" in the body: red blood, black bile, yellow bile, or phlegm respectively. Theophrastus, a pupil of Aristotle, described, with examples, thirty extreme types of personality (*e g* the talkative, the boorish, the miserly, etc), these were basically literary and imaginative but about the same time "physiognomy" arose which attempted to interpret character from the face. Physiognomy became of importance again during the Renaissance and there are still those today who believe in it in spite of the fact that, broadly speaking, there is no connection whatever between facial features and personality (*i e* although it may be possible to tell from the features that a man is an idiot or some extreme abnormal type and some idea of character may be obtained from an individual's characteristic facial expressions, it is not possible to tell (as Johann Lavater, the best-known physiognomist of the late 18th cent believed) from the shape of the nose, height of the brow, or dominance of the lower jaw, whether anyone is weak, intellectual, or determined). The contention of the 19th cent Italian criminologist Cesare Lombroso that criminals show typical facial characteristics—prominent cheekbones and jaw, slanting eyes, receding brow, large ears of a particular shape—was disproved by Karl Pearson early this century when he found that 3,000 criminals showed no significant differences of features, carefully measured, from a similar number of students at Oxford and Cambridge.

It has, however, been noted that people in general tend to be intellectual or emotional,

inward- or outward-looking, and this observation is reflected in the classifications of the Scottish psychologist, Alexander Bain (d. 1903), into intellectual, artistic, and practical, Nietzsche's Apollonian and Dionysian types, William James's "tender" and "tough-minded", and C. G. Jung's introvert and extrovert. Careful experiments have shown that these are not clear-cut and that most individuals fall in between the extremes.

Some connection has been found between temperament and body-build. Ernst Kretschmer (b. 1888) showed that manic-depressive patients and normal people who are extroverted and tend to alternate in mood (as do manic-depressives to an exaggerated degree) are usually short and stout or thick-set in build; schizophrenics and normal people, who both show shyness, serious or introverted reactions, are usually tall and slender. The former of "pyknic" body-build are "cyclothyme" in temperament, the latter with "schizothyme" temperament are of two bodily types—the tall and thin or "asthenic" and the muscularly well-proportioned or "athletic". The American Sheldon has confirmed these observations on the whole and gone into further details. Louis Berman has classified personalities according to the endocrine glands predominating: thus the "adrenal" type is vigorous and persistent, those whose adrenal glands are less active tend to become neurasthenic, the hyperthyroid type is restless, the subthyroid listless, the individual in whom the front part of the pituitary is active is masculine to a high degree, when the posterior pituitary is active he may show feminine traits. It is quite true that in disease of these glands such traits develop but most scientists agree that Berman is over-enthusiastic in his claims so far as normal people are concerned.

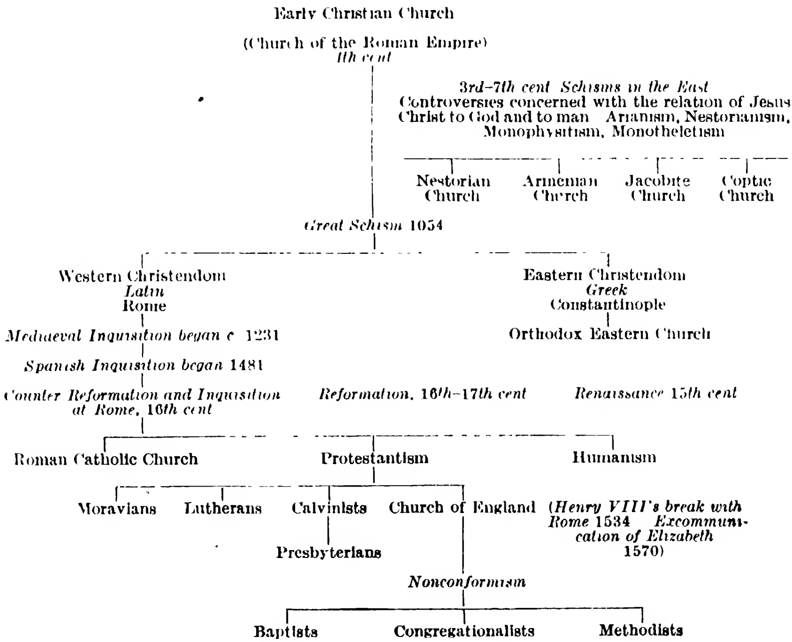
Chartism, a socialistic movement in England (1837–55) which attempted to better the conditions of the working classes. Named after "The People's Charter" of Francis Place (1838), its programme demanded (1) universal manhood suffrage, (2) vote by ballot, (3) equal electoral districts, (4) annual parliaments, (5) payment of members, (6) abolition of their property qualifications. Chartism was supported by the Christian socialists (*q.v.*), J. F. D. Maurice (1805–72), and Charles Kingsley (1819–75) with certain qualifications.

Chauvinism, a term applied to any excessive devotion to a cause, particularly a patriotic or military one. The word is derived from Nicholas Chauvin whose excessive devotion to Napoleon made him a laughing-stock.

Chirognomy, the attempt to read character from the lines in the hand (as contrasted with **Chiromancy**, the superstitious attempt to foretell the future in the same way) has few supporters, and not many psychologists would accept that handwriting reveals character in any way that is of practical use. It is highly probable that everything about an individual's acts or productions is *potentially* capable of revealing something about his character; the practical question is whether at present we can interpret them and it is ordinarily agreed that, in the case of the hand and handwriting, we can not.

Christadelphians, a religious denomination formed in the U.S.A. about 1848 at the time of the American Civil War by John Thomas, an Englishman from London. They claim to represent the simple apostolic faith of the 1st cent., and hold that they alone interpret the Scriptures truly. None but those who share their beliefs will rise from the dead and enjoy immortal life when Christ returns after the battle at Armageddon when His kingdom will be established on earth with its capital in Jerusalem. The political events of our time are regarded as fulfilments of biblical prophecies preceding the millennial reign of Christ over the earth. For them heaven and hell do not exist. In social life Christadelphians keep to themselves and hold aloof from organisational activities, though they do take an interest in political events if only from the point of view of their belief in biblical prophecy.

Christianity, the religion founded by Jesus Christ whose teaching is found in the New Testament's four Gospels. Simple as His creed may seem it soon became complicated by the various ways in which Christians interpreted it, and the differences within the early Church are reflected



in the numerous Councils held to define truth from heresy The Eastern Church of the Byzantine Empire from the 5th cent. onwards had differed in various ways from the See of Rome and by 1054 the breach became permanent The 16th cent Reformation was the other great break in the unity of the Church and once Protestantism had given in effect the right to each man to interpret the Scriptures in his own way, the tendency to fragmentation increased so that, by 1650, there were no fewer than 180 sects, mostly dogmatic and intolerant towards each other Today there are many more, some of which are mentioned in this section under the appropriate headings Nevertheless there are signs today that the trend of disunity is being reversed The modern oecumenical movement, which has its roots in the great missionary movement of the 19th cent, aims to bring about a reunion of Christendom by uniting Christians throughout the world on the simple basis of the acceptance of Jesus Christ as God and Saviour, *i e*, on the basis of Christian fellowship The movement finds expression in the World Council of Churches (*q v*) The Christian life is expressed in the words of Christ "Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself"

Christian Democrats, a term describing the members of moderate Roman Catholic political parties existing under various names in Belgium, France, the German Federal Republic (most German Protestants are in East Germany), Italy, and the Netherlands In several of these countries they are the largest parliamentary party, their platform being based on a programme of moderate social reform advocated by members who in many cases have been active in wartime resistant movements In spite of efforts of Dr Adenauer of Germany and Sr Fanfani of Italy in 1955 a Christian Democratic International has failed to develop

Christian Science, a religious denomination founded by Mary Baker Eddy (1821-1910), an American lady who sought to organise a church which would reinstate primitive Christianity and its lost element of healing The sacred book of the movement is *Science and Health with Key to the Scriptures* published by Mrs Eddy Its main tenets are that nothing is real save God, that man's essential nature is spiritual and wholly good, that matter, evil, disease, and sickness are unreal—illusions of our mortal minds due to "wrong thinking" Therefore doctors, medicine, surgery and drugs are rejected as irrelevant, spiritual healing being the only cure for what is really mental error Christian Scientists believe that the miracles of Jesus were the natural result of his understanding of divine law and that he expected his followers to do similar works Spiritual healing is claimed to have been brought about in many diseases by Mrs Eddy herself, by the reading of her book, and, today, by Christian Science practitioners In time disease, death, and sin will be overcome and even bad weather will cease to trouble us The name of the movement is misleading since it has nothing to do with any of the natural sciences of which Mrs Eddy had no first-hand knowledge Mrs Eddy was first interested in spiritualism, and afterwards, having been a patient of a faith-healer named Quimby, she put herself forward as a mind-healer, claiming that she herself had been divinely healed The denomination is apparently a wealthy one with widespread membership, its excellent newspaper, the *Christian Science Monitor*, read by many outside the movement, gives well-written accounts of all the world events we imagine to be going on around us

Christian Socialism, a movement launched in 1848, a year of revolutions throughout the continent, by a group in England designed to commit the Church to a programme of social reform. The leaders, notably J F D. Maurice, Charles Kingsley (both Anglican clergymen), and John Ludlow were deeply moved by the wretched conditions of the British working class and the two priests had, indeed, given active support to the Chartist movement (*q v*) However, all insisted that socialism in its existing forms ignored the spiritual needs of mankind and must be tempered with Christianity Tracts were written to expose the sweated industries, the consequences of unrestrained competition, and the evils following the enclosure system, but, more concretely, Christian socialism fostered co-operative workshops and distributive societies based on those of the Rochdale pioneers, organised a working-man's college and set up elementary classes for education, and supported the trade-union movement's right to organise and bargain for its members

No longer an organised body today, Christian socialism acts through individuals who reject Marx's teaching of revolutionary change, and seek to bring it about by the methods of action through political parties, education, and encouragement of the unions They believe that Christ's teachings can only be fully realised in a new society since Christianity implies social responsibility, and material factors are admitted to have an important bearing on the ability to lead a truly religious life In the U S A the eminent theologians Paul Tillich and Reinhold Niebuhr support these views and the Fellowship of Socialist Christians publishes quarterly *Christianity and Society* of which Niebuhr is editor The factory-padre in Britain and the Catholic worker-priests of France bear evidence to the continuing influence of the early movement The latter have been suspect by the Roman hierarchy whose official position is expressed in the papal encyclicals *Rerum Novarum* (1891) and *Quadragesimo Anno* (1931) These give no support to socialism in any form but reveal the Church's concern over industrial matters and labour problems, basically their attitude might be described as favouring "welfare capitalism"

Church of England. There is some evidence of possible continuity with the Christianity of Roman Britain, but in the main the Church derives from the fusion of the ancient Celtic church with the missionary church of St Augustine, who founded the See of Canterbury in A D 597 To archbishop Theodore in 673 is ascribed its organisation in dioceses with settled boundaries, and in parishes St Augustine's church was in communion with Rome from the first, but the Church of England was not brought within papal jurisdiction until after the Norman conquest, and was at no time under the complete domination of Rome It remains the Catholic Church of England without break of continuity, but during the Reformation the royal supremacy was accepted and that of the pope repudiated It is the Established Church (*i e*, the official church of the realm), crowns the sovereign, and its archbishops and bishops in the House of Lords can act as a kind of "conscience of the state" at every stage of legislation The policy of religious toleration has been accepted since the 16th cent The Church is organised in two ecclesiastical provinces (Canterbury and York) and 43 dioceses

The Anglican Communion comprises the churches in all parts of the world which are in communion with the Church of England All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (last held in 1958), over which the Archbishop of Canterbury by custom presides as *primus inter pares* The Conference has no legislative power, but in practice exercises great influence

Church of Scotland. *See* **Presbyterianism.**

Clairvoyance. *See* **Telepathy.**

Communism, ideally refers to the type of society in which all property belongs to the community and social life is based on the principle "from each according to his ability, to each according to his needs" Since no such society as yet exists, the word in practice refers to the Communist Party's attempt to achieve such a society by initially overthrowing the capitalist system and establishing a dictatorship of the proletariat The modern movement is based on Marxism as further developed by Lenin who applied Marx's analysis to the new conditions which had arisen in 20th cent. capitalist society Noting the large trusts and combines which (according to the Marxian "theory of concentration") with their large concentrations of capital were ousting the small producers of an earlier stage, Lenin concluded that the state

(representing the ruling class) and these large capital interests were collaborating in imperialist policies which would inevitably lead to recurrent wars, that the skilled worker would become more important and, receiving higher wages, would betray the proletariat by moving to the right, and that the poorer workers would continue to support revolutionary socialism Communists believe that their first task is the establishment of socialism under which there remain class distinctions, private property to some extent, and differences between manual and brain workers The state is regulated on the basis "from each according to his ability, to each according to his work" In time this gives place to communism as described above and the state will wither away Marxism-Leninism develops continuously with practice since failure to apply its basic principles to changed circumstances and times would result in errors of dogmatism Two fundamental principles of communism are (1) peaceful co-existence between countries of different social systems, and (2) the class struggle between oppressed and oppressing classes and between oppressed and oppressor nations China, for example, holds that it is a mistake to lay one-sided stress on peaceful transition towards socialism otherwise the revolutionary will of the proletariat becomes passive and unprepared politically and organisationally for the tasks ahead *See also* **Trotskyism**

Confessional Church, Lutherans in Germany who, led by Pastor Niemoller (b 1892), opposed those teachings of the Nazi regime which they found incompatible with Christianity

Confucianism. Confucius (Latinised form of K'ung-Fu-tzu) was born in 551 B C in the feudal state of Lu in modern Shantung province He was thus a contemporary of Buddha, although nobody could have been more dissimilar. Where Buddha was metaphysical in his thought, Confucius was practical. Buddha was original, Confucius had hardly an original idea in his head; Buddha wanted to convert individuals to an other-worldly philosophy, Confucius wanted to reform the feudal governments of his time, believing that in this way their subjects would be made happier Other religions have, in their time, been revolutionary, Confucius was a conservative who wanted to bring back a golden age from the past The only respect in which Confucius agreed with the Buddha was that neither was particularly interested in the supernatural, and God or gods played little part in their religions

Much of his time was spent in going from the court of one feudal lord to another trying to impress them by his example. For he suffered from the curious belief that the example set by the ruler influences his subjects He made much of etiquette, trembling and speaking in low tones before princes, at ease and polite with his equals, and behaving with "lofty courtesy" to his inferiors Promoting the idea of "the golden mean," he was not impressed by heroic deeds or unusual people, and was greatly displeased when he heard that a truthful son had reported that his father had stolen a sheep "Those who are upright," he said, "are different from this, the father conceals the misconduct of the son, and the son conceals the misconduct of the father" One feels that Confucius would have felt not at all out of place in an English public school Virtue brings its own reward in this world, ceremonial is important, politeness when universal would reduce jealousy and quarrels, "reverence the spirits but keep them far off" Destiny decides to what class a man shall belong, and as destiny is but another name for Nature prayer is unnecessary, for once having received his destiny, a man can demand and obtain from Nature what he chooses—his own will determines all things

Although not very successful in his lifetime so far as the rulers were concerned, Confucius found numerous disciples before his death at the age of 70 who collected his teachings which are found, together with those of his later follower Mencius (372–289 B C), in the *Wu Ching* (five classics), and the *Shih Shu* (four books) which contain the Analects, The Great Learning, The Doctrine of the Mean, and the Book of Mencius In time Confucianism became with Taoism and Buddhism one of the main religions in China Unlike Buddhism it had little influence elsewhere.

Congregationalists, the oldest sect of Nonconformists who hold that each church should be independent of external ecclesiastical authority They took their origin from the Brownists of Elizabeth's days Robert Browne (c 1550–c 1633), an Anglican clergyman, who had come to reject bishops, was forced with his followers to seek refuge, first in Holland and then in Scotland where he was imprisoned by the Kirk In later life he changed his views and is disowned by Congregationalists because of his reversion to Anglicanism His former views were spread by Henry Barrow and John Greenwood who, under an Act passed in 1592 "for the punishment of persons obstinately refusing to come to church" (and largely designed for the suppression of this sect), were hanged at Tyburn They had preached (*a*) that the only head of the church is Jesus Christ, (*b*) that, contrary to Elizabethan doctrine, the church had no relationship to the state, (*c*) that the only statute-book was the Bible whereas the Articles of Religion and the Common Prayer were mere Acts of Parliament, (*d*) that each congregation of believers was independent and had the power of choosing its own ministers The body fled once more to Holland and were among the Pilgrims who set sail in the *Mayflower* for America in 1620 whilst those who remained were joined by Puritans fleeing from Charles I They became free once more to live in England under the Commonwealth only to be repressed again under Charles II Finally full liberty of worship was granted under William III In 1833 the Congregational Union of England and Wales was formed which has no legislative power It has issued a Declaration of Faith by which no minister is bound, he is responsible to his own church and to nobody else The sect is widespread both in Britain and the U S A where it is held in special honour because of its connection with the Pilgrim Fathers

Conservatism. The name "Conservative" came into general use after 1834 in place of the older name of "Tory," although "Tory democracy" is now widely used to describe Conservative social reform policy Originally the party of the aristocracy and landed gentry, Conservatism has been supported from the end of the 19th cent by the large business interests, and more recently by lower-income groups in the population which disapprove of state control Although originally based upon the teachings of Burke and Disraeli, Conservative doctrine has been considerably modified, especially since 1945 after defeat by the socialists The Party's *Industrial Charter* envisages a system which reconciles the need for central direction with encouragement of individual enterprise The Conservatives have held office since 1951, having increased their parliamentary strength in three successive general elections On the continent, Conservatism has generally been identified with fear of social progress, exaggerated respect for authority, and nationalism, such parties have more often than not been extremely reactionary and anti-democratic *See* **Liberalism, Socialism,** *also* **Section C, Part I**

Coptic Church, the sect of Egyptian Christians who, holding "Monophysite" opinions (*i e*, refusing to grant the two natures, God and Man, of Christ), were declared heretical by the Council of Chalcedon in 451 Their practice of circumcision and their language may derive from the religion of ancient Egypt, but otherwise they, like the Armenians, are regarded as heretical branches of Eastern Christianity. Their patriarch is at Alexandria

Cynics, a school of philosophy founded in the time of Alexander the Great by Diogenes Choosing to live like a dog by rejecting all conventions of religion, manners, or decency, and allegedly living in a tub, Diogenes unwittingly brought on his school the title "Cynic," meaning not "cynical," as the word is understood today, but "canine" His teacher, Antisthenes, who had been a disciple of Socrates, decided, after the latter's death, that all philosophy was useless quibbling and man's sole aim should be simple goodness He believed in a return to

nature, despised luxury, wanted no government, no private property, and associated with working men and slaves Far from being cynics in the modern sense, Diogenes and Antisthenes were virtuous anarchists rather like old Tolstoy (except that in the practice of their beliefs they were more consistent).

Darwinism. *See* **Section F, Part II.** *See also* **Vitalism.**

Deism. *See* **God and Man.**

Demonism, Demons, and the Devil. Demons are ethereal beings of various degrees of significance and power which are believed to be implicated in men's good, but especially evil, fortune They are common to most cultures From the anthropological point of view the demon arose as a widespread concept in the following ways (1) as a psychological projection into the outer world of man's own good or evil emotions and thoughts, (2) as a survival of primitive animism (*q v*), thus spirits are believed to haunt places, trees, stones, and other natural objects, (3) when by warlike invasion the gods of the vanquished become the devils of the conquerors (as when the Jews occupied Canaan), (4) as a primitive belief that spirits of the dead continue after death to hover near their former habitation, and not always entirely welcome to the living; (5) the conception of a supreme source of evil (the Devil or Satan) which took shape among the Jews during their sojourn in Babylon under the influence of Zoroastrianism (*q v*), a religion in which the struggle between the two spirits, Good and Evil, reached its height in the imagination of the ancient world The Satan of the Old Testament was first regarded as one of God's servants (in the Book of Job he goes up and down the earth to see whether God's commands are obeyed), but when the Jews returned from their captivity he had become identified with Ahriman, the spirit of evil, who was in continual conflict with Ahura Mazda, the spirit of good As Dr Margaret Murray has pointed out, the primitive mind ascribed both good and evil to one power alone, the division into God and the Devil, priest and witch, belongs to a higher stage of civilisation *See also* **Witchcraft, Magic.**

Determinism and Free-will. The question of whether man is, or is not, free to mould his own destiny is one which has exercised the minds of philosophers since Greek mythology conceived of the Fates as weaving a web of destiny from which no man can free himself Socrates emphasised that man could through knowledge influence his destiny whilst ignorance made him the plaything of fate. Plato went further in pointing out that man can, and does, defeat the purposes of the universe and its divine Creator It is our duty to live a good life, but we can live a foolish and wicked one if we choose Aristotle wrote " Virtue is a disposition or habit involving deliberate purpose or choice " If this were not so morality would be a sham

The Problem for Theology The last of the great philosophers of antiquity and one of the great influences in moulding Catholic theology was Plotinus (*c* 204–270) Soul, he taught, is free, but once enmeshed in the body loses its freedom in the life of sense Nevertheless, man is free to turn away from sensuality and towards God who is perfect freedom, for even when incarnated in matter the soul does not entirely lose the ability to rescue itself This conception was carried over into the beliefs of the Early Christian Apologists because it appeared to be in line with the teaching of Jesus that He had come to save man from sin Sin implies guilt, and guilt implies the freedom to act otherwise, furthermore an all-good God cannot be responsible for the sin in the world which must be man's responsibility and this again implies freedom Pelagius (*c* 355–*c* 425), a Welsh priest, not only believed in freewill but, questioning the doctrine of original sin, said that when men act righteously it is through their own moral effort, and God rewards them for their virtues in heaven. This belief became fairly widespread and was declared a heresy by the Church, being attacked notably by St. Augustine (354–430), a contemporary of Pelagius, who believed in predestination—that, since the sin of Adam, God had chosen who in all future history would be saved and who damned This represents one tradition in Christianity the determinism which leads to Calvinism (*q v*). St Thomas Aquinas (1227–74), the greatest figure of scholasticism and one of the principal saints in the Roman Catholic Church, compromised between the two positions in the sense that, believing man to be free, he yet held that Adam's sin was transmitted to all mankind and only divine grace can bring salvation But even when God wishes to bestow this salvation, the human will must cooperate God foresees that some will not accept the offer of grace and predestines them to eternal punishment

The Problem for Philosophy With the Renaissance, thinkers began to free themselves from the domination of the Church and to study the world objectively and freely without preconceptions But the more man turned to science, the more he discovered that the world was ruled by apparently inexorable laws and, since the scientist must believe that every event has a cause, he was led back to determinism. Man as part of the universe was subject to law too and all that existed was a vast machine Francis Bacon (1561–1626) separated the fields of religion and science but left man subject completely to the will of God Thomas Hobbes (1588–1679) was a rigid determinist and materialist although, having had trouble with the church in France whence, as a royalist, he had fled, he took care to announce that the Christian God is the Prime Mover

Modern philosophy begins with René Descartes (1596–1650), a Frenchman who tried to reconcile the mechanical scientific universe of his time with the spiritual need for freedom He did this by separating completely mind and body, the former, he said, is free, the latter completely determined But, by admitting that the will can produce states of body, he was left with the problem of how this could happen—a problem which the so-called Occasionists solved to their own satisfaction by stating that the will is free and God so arranges the universe that what a person wills happens Baruch Spinoza (1632–77), a Dutch Jew whose independence of thought had led to his excommunication from the Amsterdam Synagogue in 1656, was a complete determinist He asserted that God and Nature are one, everything that happens is a manifestation of God's inscrutable nature, and it is logically impossible that things could be other than they are Thus both Hobbes and Spinoza were determinists for entirely opposed reasons The former as a materialist, the latter because he believed in the absolute perfection and universality of God Yet the great religious mystic and mathematician Blaise Pascal (1623–62) held that, no matter what reason and cold logic may indicate, we *know* from direct religious experience that we are free John Calvin (1509–64) and Martin Luther (1483–1546) were both determinists *See* **Calvinism, Lutheranism.**

To the more practical British philosophers, John Locke (1632–1704) and David Hume (1711–76), free-will was related to personality Locke believed that God had implanted in each individual certain desires and these determine the will; the desires are already there, but we use our will to satisfy them Hume argued that a man's behaviour is the necessary result of his character and if he had a different character he would act otherwise Accordingly, when a man's actions arise from his own nature and desires he is free He is not free when external events compel him to act otherwise (*e g*, if he strikes another because his own nature is such he is free as he is not if he is compelled to do so against his desire) Leibnitz (1646–1716), although as a German metaphysical philosopher holding very different general views, said much the same thing—that choice is simply selecting the desire that is strongest. But most of the 18th cent from Voltaire onwards, with the great exceptions of Rousseau and the later German philosophers Kant, Fichte, Schopenhauer, and Hegel, who were initially influenced by him,

accepted determinism Rousseau (1712–78) began to stem the tide by his declaration that man is a free soul striving to remain free and only prevented from being so by society and the cold science which stifles his feeling heart Once again the will became important as Kant (1724–1804) asserted that belief in freedom is a moral necessity although it cannot be proved by reason, the moral nature of man shows that there is a " transcendental " world beyond the senses where freedom applies Fichte and Schelling found freedom in the Absolute ego or God of whom each individual was part and thus also free Hegel (1770–1831) saw the whole universe as evolving towards self-awareness and freedom in man although this could only be fully realised in a society that makes for freedom Even God himself only attains full consciousness and self-realisation through the minds of such individuals as are free This is the goal of the dialectical process (*See* **Dialectical Materialism**)

The Scientist's View For the scientist the law of cause and effect is a useful hypothesis since, by and large, it is necessary for him to assume that all events are caused Nevertheless the modern tendency is to think in terms of statistical probability rather than relentless mechanistic causality, and, although the free-will problem does not concern the scientist as such, it is clear that freedom and determinism (assuming the terms to have any meaning at all) are not necessarily opposed In sociology, for example, we *know* that certain actions will produce certain results upon the behaviour of people in general, *e g*, that raising the bank rate will discourage business expansion But this does not mean that Mr Brown who decides in the circumstances not to add a new wing to his factory is not using his free-will Even in the case of atoms, as Dr Bronowski has pointed out, the observed results of allowing gas under pressure in a cylinder to rush out occur because most of the atoms are " obeying " the scientific " law " relating to such situations But this does not mean that some atoms are not busy rushing across the stream or even against it- -they are, but the general tendency is outwards and that is what we note Lastly, the modern philosophical school of Logical Analysis would probably ask, not whether Free-will or Determinism is the true belief, but whether the question has any meaning For what scientific experiment could we set up to prove one or the other true? The reader will note that some of the philosophers mentioned above are using the words to mean quite different concepts

Dialectical Materialism, the combination of Hegel's dialectic method with a materialist philosophy produced by Karl Marx (1818–83) and his friend Friedrich Engels (1820–95) It is the philosophical basis of **Marxism** (*q v*) and **Communism** (*q v*) " Dialectic " to the ancient Greek philosophers meant a kind of dialogue or conversation, as used particularly by Socrates, in which philosophical disputes were resolved by a series of successive contradictions a thesis is put forward and the opposing side holds its contradiction or antithesis until in the course of argument a synthesis is reached in which the conflicting ideas are resolved

From Thesis through Antithesis to Synthesis Hegel in the 19th cent put forward the view that this process applies to the course of nature and history as they strive towards the perfect state But to him, as to the Greeks, the conflict was in the field of ideas The " universal reason " behind events works through the ideas held by a particular society until they are challenged by those of another which supersedes them and in turn, usually by war, becomes the agent of universal reason until the arrival of a new challenger Hegel therefore regarded war as an instrument of progress and his Prussian compatriots found no difficulty in identifying their own state as the new agent of progress by universal conquest Feuerbach, Lassalle, and other early socialists were impressed by some of Hegel's ideas *e g*, that societies evolved (with the assumption that finally their own ideal society would be achieved) and that truth, morals, and concepts were relative so that a type of society that was " good " at one time was not necessarily so at another. But Marx and Engels in effect turned Hegel upside-down, accepted his dialectic but rejected his belief that ideas were the motive force On the contrary, they said, ideas are determined by social and economic change as a result of materialistic forces (*See* **Calvinism**, where it is pointed out that the Marxist view is not that Calvin changed men's economic ideas but rather that a developing capitalism unconsciously changed his) The historical materialism of Marxism purports to show that the inexorable dialectic determines that feudalism is displaced by capitalism and capitalism by creating a proletariat (its antithesis) inevitably leads to socialism and a classless society The state, as a tool of the dominant class, withers away Dialectical materialism is applied in all spheres As a philosophy there is little to be said for it save that it has shown us the close dependence of man's thoughts upon current material and social conditions But as a battle-cry or a rationalisation of Marxism it wields immense power over the minds of men *See* **Marxism**

Diggers, one of the many sects which flourished under the Commonwealth (others were the Muggletonians, the Levellers, the Millenarians, and the Fifth Monarchy Men), so-called because they attempted to dig (*i e* cultivate) untilled land Gerrard Winstanley, a profoundly religious man, and leader of the Diggers, believed in the economic and social equality of man and castigated the clergy for upholding the class structure of society In his book *The True Leveller's Standard Advanced* (1649) he wrote " Every day poor people are forced to work for fourpence a day, though corn is dear And yet the tithing priest stops their mouth and tells them that ' inward satisfaction of mind ' was meant by the declaration ' the poor shall inherit the earth' I tell you, the Scripture is to be really and materially fulfilled You jeer at the name ' Leveller ', I tell you Jesus Christ is the Head Leveller "

Docetists, a Gnostic sect (*q v*) during the early centuries of Christianity who believed that, since it was unworthy that the Son of God should have died a humiliating death on the cross, the entity that was crucified was a mere phantom Mohammed, who believed in Jesus as a prophet but not as divine, adopted these views The heretical Albigenses were influenced by Docetism, Gnosticism, and Manichaeism (*qq v*)

Doukhobors, a religious sect of Russian origin, founded by a Prussian sergeant at Kharkov in the middle of the 18th cent, and now mainly settled in Canada Like many other sects they belong to that type of Christianity which seeks direct communication with God and such bodies tend to have certain traits in common, such as belief in the " inner light," opposition to war and authority in general, and often ecstasies which show themselves in physical ways such as shaking, speaking in strange tongues (glossolalia), and other forms of what to the unbeliever seem mass hysteria Liturgy, ritual, or ceremony is non-existent Among such are the Quakers, Mennonites, Moravians, and others although it is not suggested that every one of these sects exhibits all the traits mentioned The Doukhobors were naturally a trial to Tsarist Russia and were moved from place to place ending up in Georgia until, in 1887, Russia introduced conscription to which they naturally refused to submit They were persecuted (as they had been from the start), but in 1898 Tolstoy used his influence to have them removed to Canada where the government granted them uninhabited land in what is now Saskatchewan and seven or eight thousand settled down in peace which they enjoyed for many years Recently, however, their practices have caused difficulties once more, for even the most tolerant government which is prepared to accept pacifism, total dependence on communally-owned agriculture, refusal to engage in commerce, non-payment of taxes, rejection of the marriage ceremony and separation " when love ceases," finds it difficult to tolerate, as civilisation advances ever closer to Doukhobor communities, their proneness to " put off these troublesome disguises which we wear "—*i.e*, to

walk about naked in the communities of their more orthodox neighbours What the future of the Doukhobors in their various sects (for even they have their differences) will be it is impossible to say, but it is difficult to believe that these simple people can long resist the pressure of modern civilisation.

Druidism, the religion of Celtic Britain and Gaul of which Druids were the priesthood They were finally wiped out by the Roman general Suetonius Paulinus about A D 58 in their last stronghold, the island of Anglesey There are two sources of our present beliefs in Druidism (1) the brief and factual records of the Romans, notably Pliny and Julius Caesar, which tell us that they worshipped in sacred oak groves and presumably practised a religion doing reverence to the powers of nature which must have had its roots in early stone age times and had many cruel rites *e g*, human sacrifice, (2) the beliefs put forward by William Stukeley, an amateur antiquarian who from 1718 did valuable work by his studies of the stone circles at Stonehenge and Avebury However, influenced by the Romantic movement, he later put forward the most extravagant theories which unfortunately are those popularly accepted by those without archaelogical knowledge today Stonehenge and Avebury were depicted as the temples of the "white-haired Druid bard sublime" and an attempt was made to tie up Druidism with early Christianity, above all with the concept of the Trinity The avenues leading to the stone circles were supposed to symbolise "a snake proceeding from a circle—the eternal procession of the Son from the First Cause" In fact, these circles have no connection with the Druids They may have made ceremonial use of them but recent evidence suggests that the megalithic stones at Stonehenge belong to a Bronze Age culture (1860 1560 B C) Nor have Druidism and Christianity any relationship Almost nothing is known of the religion Yet such were its romantic associations that, even today, one hears of "Druidic" ceremonies practised at the appropriate time of year on Primrose Hill in the heart of London (though whether seriously or with tongue in cheek one does not know)

Dualism, any philosophical or theological theory which implies that the universe has a double nature, notably Plato's distinction between appearance and reality, soul and body, ideas and material objects, reason and the evidence of the senses, which infers that behind the world as we perceive it there lies an "ideal" world which is more "real" than that of mere appearance In religions such as **Zoroastrianism** or the **Gnostic** and **Manichaeism** heresies (*qq v*), it was believed that the universe was ruled by good and evil "principles"—in effect that there was a good God and a bad one In psychology, dualism refers to the philosophical theories which believe mind and body to be separate entities The opposite of dualism is monism which asserts the essential unity of the substance of the universe

E

Education. Education was no great problem to primitive man, but as societies became more complex people began to ask themselves such questions as *What* should young people be taught? *How* should they be taught? Should the aim of their education be to bring out their individual qualities or rather to make them good servants of the state?

The first teachers were priests who knew most about the traditions, customs, and lore of their societies and thus the first schools were in religious meeting places This was notably true of the Jews who learned from the rabbis in the synagogue, and throughout the Middle Ages in Christendom as will be seen later

The Greeks We begin, as always, with the Greeks whose city-states, based on slavery, educated men (not women) for the sort of life described in Plato's *Dialogues*—the leisured life of gentlemen arguing the problems of the universe at their banquets or in the market-place This made it necessary to learn debate and oratory (or rhetoric) especially for those who proposed to take up politics. The Sophist philosophy taught the need to build up convincing arguments in a persuasive manner, to learn the rules of logic and master the laws and customs of the Athenians, and to know the literature of the past so that illustrations might be drawn from it These strolling philosophers who taught for a fee were individualists showing the student how to advance himself at all costs within his community

Socrates had a more ethical approach, believing that education was good in itself, made a man happier and a better citizen, and emphasised his position as a member of a group His method of teaching, the dialectic or "Socratic" method, involved argument and discussion rather than overwhelming others by rhetoric and is briefly mentioned under **Dialectical Materialism** (*q v*) Today this method is increasingly used in adult education where a lecture is followed by a period of discussion in which both lecturer and audience participate, for psychologists have shown that people accept ideas more readily when conviction arises through their own arguments than when they are passively thrust down their throats

Socrates' pupil Plato produced in his book *The Republic* one of the first comprehensive systems of education and vocational selection Believing that men are of different and unequal abilities he considered that they should be put into social classes corresponding to these differences, and suggested the following method (1) For the first 18 years of a boy's life he should be taught gymnastics and sports, playing and singing music, reading and writing, a knowledge of literature, and if he passed this course sent on to the next stage, those who failed were to become tradesmen and merchants (2) From 18–20 those successful in the first course were to be given two years of cadet training, the ones thought incapable of further education being placed in the military class as soldiers (3) The remainder, who were to become the leaders of society, proceeded with advanced studies in philosophy, mathematics, science, and art Such education was to be a state concern, state supported and controlled, selecting men and training them for service in the state according to their abilities

Plato's pupil Aristotle even suggested that the state should determine shortly after birth which children should be allowed to live and destroy the physically or mentally handicapped, that marriage should be state-controlled to ensure desirable offspring However, in their time the leisured and individualistic Sophists held the field and few accepted the educational views of Plato or his pupil

Rome The Romans were not philosophers and most of their culture came from Greece Administration was then chief aptitude and Quintilian (A D c 35–c 95) based his higher education on the earlier classical tuition in public speaking, but he is important for emphasising the training of character and for his humanistic approach to the method of teaching that caused his *Institutio oratoria* to be influential for centuries later—indeed one might almost say up to the time of the great Dr Arnold of Rugby Education, he believed, should begin early but one must "take care that the child not old enough to love his studies does not come to hate them" by premature forcing, studies must be made pleasant and interesting and students encouraged by praise rather than discouraged when they sometimes fail, play is to be approved of as a sign of a lively disposition and because gloomy, depressed children are not likely to be good students, corporal punishment should never be used because "it is an insult as you will realise if you imagine it yourself" The world became interested not in *what* he taught but *how* he taught it, he was the pioneer of humanistic education and character-training from Vittorino da Feltre (1378–1446) of Mantua, through Milton and Pope who commended his works, to the modern educationists who have studied their pupils as well as their books

The Middle Ages The Religious View With the development of Christianity education once more became a religious problem The earliest

converts had to be taught Christian doctrine and were given instruction in " catechumenal " schools before admission to the group, but as the religion came increasingly into contact with other religions or heresies a more serious training was necessary, and from these newer " catechetical " schools, where the method used was the catechism (i e , question and answer as known to all Presbyterian children today), the Apologists arose among whom were Clement of Alexandria and the great Origen From this time education became an instrument of the church and in 529 the Emperor Justinian ordered all pagan schools to be closed

As typical of the best in mediaeval education whilst the lamp of civilisation burned low during the Dark Ages, after the fall of Roman power, and survived only in the monasteries, we may mention St Benedict (c 480–c 547) of Monte Cassino. There, in southern Italy, a rule was established which became a part of monastic life in general Monastic schools were originally intended for the training of would-be monks, but later others were admitted who simply wanted some education, thus two types of school developed one for the *interni* and the other for *externi* or external pupils Originally studies were merely reading in order to study the Bible, writing to copy the sacred books, and sufficient calculation to be able to work out the advent of holy days or festivals But by the end of the 6th cent the " seven liberal arts " (grammar, rhetoric, dialectic, arithmetic, geometry, music, and astronomy) were added

The Renaissance The close of the Middle Ages saw the development of two types of secular school One came with the rise of the new merchant class and the skilled trader whose " guilds " or early trade unions established schools to train young men for their trades but ultimately gave rise to burgher or town schools, the other was the court school founded and supported by the wealthy rulers of the Italian cities—Vittorino da Feltre (mentioned above) presided over the most famous at Mantua

These Renaissance developments are paralleled in northern Europe by the Protestant reformers who, having with Martin Luther held that everyone should know how to read his Bible in order to interpret it in his own way, were logically committed to popular education, compulsory and universal In theory this was intended for biblical study, but writing, arithmetic, and other elementary subjects were taught and Luther said that, even if heaven and hell did not exist, education was important Universal education is a Protestant conception

Views of Philosophers From this period onwards people were free to put forward any ideas about education, foolish or otherwise, and to create their own types of school Of English philosophers who theorised about, but did not practise, education we may mention the rationalist Francis Bacon (1561–1626) who saw learning as the dissipation of all prejudices and the collection of concrete facts, the materialist and totalitarian Hobbes (1588–1679) who, as a royalist, believed that the right to determine the kind of education fit for his subjects is one of the absolute rights of the sovereign power or ruler, the gentlemanly Locke (1632–1704) whose ideal was a sound mind in a sound body to be attained by hard physical exercise, wide experience of the world, and enough knowledge to meet the requirements of the pupil's environment The end result would be one able to get on with his fellows, pious but wise in the ways of the world, independent and able to look after himself, informed but reticent about his knowledge. Classics and religious study were not to be carried to excess, since Locke held that these subjects had been overrated in the past Locke's pupil was the well-to-do, civilised young man of the 17th cent who knew how to behave in society.

Jean-Jacques Rousseau (1712–78) was a forerunner of the Romantic movement which despised society and put emotion at a higher level than reason His book *Emile* describes the education of a boy which is natural and spontaneous Society, he holds, warps the growing mind and therefore the child should be protected from its influences until his development in accordance with his own nature is so complete that he cannot be harmed by it. During the first 4 years the body should be developed by physical training, from 5 to 12 the child would live in a state of nature such that he could develop his powers of observation and his senses, from 13 books would be used and intellectual training introduced, although only in line with the child's own interests, and he would be given instruction only as he came to ask for it Moral training and contact with his fellows to learn the principles of sympathy, kindness, and helpfulness to mankind would be given between 15 and 20 Girls, however, should be educated to serve men in a spirit of modesty and restraint

Summary Broadly speaking, then, there have been four main attitudes to education (1) religious, with a view to a life beyond death; (2) state-controlled education, with a view to uniform subservience to authority, (3) " gentlemanly " education, with a view to social graces and easy congress in company; (4) the " child-centred " education, which attempts to follow the pupil's inner nature It is unnecessary to mention the ordinary method of attempting to instil facts without any considerable degree of co-operation between pupil and teacher in order that the former may, with or without interest, follow some occupation in adult life; for this the philosophers did not consider Today there remain the two fundamental principles education for the advantage of the state and its ideology or education for individual development and freedom

Four educationists of the modern period who have influenced us in the direction of freedom were Johann Pestalozzi of Switzerland (1746–1827) who, by trying to understand children, taught the " natural, progressive, and harmonious development of all the powers and capacities of the human being ", Friedrich Froebel (1782–1852) of Germany, the founder of the Kindergarten who, like Pestalozzi, was influenced by Rousseau but realised the need to combine complete personal development with social adjustment, Maria Montessori (1869–1952) whose free methods have revolutionised infant teaching, John Dewey (1859–1952) who, as philosopher and educationist, held that the best interests of the group are served when the individual develops his own particular talents and nature

Eleatics, the philosophers of Elea in ancient Greece who, at the time when Heraclitus (c 535–475 B C) was teaching that change is all that exists and nothing is permanent, were asserting that change is an illusion Of the three leaders of this school, Xenophanes asserted that the universe was a solid immovable mass forever the same; Parmenides explained away change as an inconceivable process, its appearance being due to the fact that what we see is unreal, and Zeno (the best-known today) illustrated the same thesis with his famous argument of the arrow which, at any given moment of its flight, must be where it is since it cannot be where it is not But if it is where it is, it cannot move, this is based, of course, on the delusion that motion is discontinuous The Eleatics were contemporaries of Socrates

Empiricism. While not a single school of philosophy, empiricism is an approach to knowledge which holds that if a man wants to know what the universe is like the only correct way to do so is to go and look for himself, to collect facts which come to him through his senses It is, in essence, the method of science as contrasted with rationalism (*q v*) which in philosophy implies that thinking or reasoning without necessarily referring to external observations can arrive at truth. Empiricism is typically an English attitude, for among the greatest empirical philosophers were John Locke, George Berkeley, and David Hume. *See* **Rationalism**

Epicureanism. The two great schools of the Hellenistic period (*i e* the late Greek period beginning with the empire of Alexander the Great) were the Stoics and Epicureans, the former founded by Zeno of Citium (*not* to be confused with Zeno the Eleatic) (*q v*), the latter by Epicurus, born in Samos in

342 B.C. Both schools settled in Athens, where Epicurus taught that "pleasure is the beginning and end of a happy life." However, he was no sensualist and emphasised the importance of moderation in all things because excesses would lead to pain instead of pleasure and the best of all pleasures were mental ones. Pleasures could be active or passive but the former contain an element of pain since they are the process of satisfying desires not yet satiated. The latter involving the absence of desire are the more pleasant. In fact, Epicurus in his personal life was more stoical than many Stoics and wrote "when I live on bread and water I spit on luxurious pleasures." He disapproved of sexual enjoyment and thought friendship one of the highest of all joys. A materialist who accepted the atomic theory of Democritus, he was not a determinist, and if he did not disbelieve in the gods he regarded religion and the fear of death as the two primary sources of unhappiness.

Epiphenomenalism. *See* **Mind and Body.**

Erastianism, the theory that the state has the right to decide the religion of its members, wrongly attributed to Erastus of Switzerland (1524–83) who was believed to have held this doctrine. The term has usually been made use of in a derogatory sense—*e.g.*, by the Scottish churches which held that the "call" of the congregation was the only way to elect ministers at a time when, about the turn of the 17th and 18th cent., they felt that Episcopalianism was being foisted on them. "Episcopalianism" (*i.e.* Anglicanism) with its state church, ecclesiastical hierarchy, and system of livings presented by patrons was to them "Erastian" in addition to its other "unscriptural practices."

Essenes, a Jewish sect which, during the oppressive rule of Herod (d. 4 B.C.), set up monastic communities in the region of the Dead Sea. They refused to be bound by the scriptural interpretations of the Pharisees and adhered rigorously to the letter of Holy Writ, although with additions of their own which cause them by orthodox Jews today to be regarded as a break-away from Judaism. Among their practices and beliefs were baptism, initiation, meals in common and spurning of the world's riches, determinism, continence, and doctrines of heavenly rewards and hell-fire. Akin in spirit, although not necessarily identical with them, were the writers of Apocalyptic literature preaching that the evils of the present would shortly be terminated by a new supernatural order heralded by a Messiah who would reign over a restored Israel. The casting out of demons and spiritual healing formed part of these general beliefs which were in the air at that time. The sect has an importance far beyond its size or what has been known about it in the past since the discovery from 1947 onwards of the Dead Sea Scrolls (*See* **Section L**) of the Qumran community occupying a monastery in the same area as the Essenes and holding the same type of belief. These scrolls with their references to a "Teacher of Righteousness" preceding the Messiah have obvious relevance to the sources of early Christianity and have given rise to speculations as to whether Jesus might have been influenced by views which, like His own, were unacceptable to orthodox Jews but in line with those of the Dead Sea communities. At the very least they seem to show that early Christianity was not a sudden development but a gradual one which had its predecessors.

Ethical Church, a movement typical of 19th cent. rationalism which attempted to combine atheism (or at any rate the absence of any belief in a God which was inconsistent with reason or based on revelation) with the inculcation of moral principles. Prayers were not used and ordinarily the service consisted in the singing of edifying compositions interspersed with readings from poems or prose of a similar nature by great writers holding appropriate views. It terminated in a talk on an ethical or scientific theme. There is an Ethical Church in London and the South Place Institution where Moncure Conway preached from 1864 to 1897 still exists.

Ethnocentrism, the exaggerated tendency to think the characteristics of one's own group or race superior to those of any others.

Evangelicanism, the belief of those Protestant sects which hold that the essence of the Gospel consists in the doctrine of salvation by faith in the atoning death of Christ and not by good works or the sacraments; that worship should be "free" rather than liturgical through established forms; that ritual is unacceptable and superstitious. Evangelicals are Low Churchmen. The Lutheran Church of Germany, formerly the Evangelical Church, was reorganised after the war and freed from state control. It is now called the Evangelical United Brethren Church.

Evangelism, the preaching of the Gospel, emphasising the necessity for a new birth or conversion. The evangelistic fervour of John Wesley and George Whitefield (*see* Methodism) aroused the great missionary spirit of the late 18th and 19th cent. George Fox, founder of the Society of Friends (*q.v.*), was also an evangelist. Evangelists can be Low, High, or Middle Churchmen.

Existentialism, a highly subjective philosophy which many people connect with such names as Jean-Paul Sartre (b. 1905) or Albert Camus (1913–60) and assume to be a post-war movement associated with disillusion and a sordid view of life. However, existentialism stems from Soren Kierkegaard (1813–55), the Danish "religious writer"—his own description of himself—in such works as *Either/Or*, *Fear and Trembling*, and *Concluding Unscientific Postscript*. Between the two wars translations of Kierkegaard into German influenced Martin Heidegger's (b. 1889) great work *Being and Time* and the other great existentialist Karl Jaspers (b. 1883). It has strongly influenced modern Protestant theology notably in Karl Barth, Reinhold Niebuhr, and Paul Tillich and beyond that field Gabriel Marcel (b. 1887), the Spanish writer Unamuno (1864–1936) in his well-known *The Tragic Sense of Life*, and Martin Buber of Israel (b. 1878) in his *I and Thou*. We have it on Heidegger's authority that "Sartre is no philosopher" even if it is to his works that modern existentialists often turn.

Existentialism is extremely difficult for the non-metaphysically-minded to understand; it deals, not with the nature of the universe or what are ordinarily thought of as philosophical problems but describes an attitude to life or God held by the individual. Briefly, its main essentials are: (1) it distinguishes between *essence*, *i.e.*, that aspect of an entity which can be observed and known—and its *existence*—the fact of its having a place in a changing and dangerous world which is what really matters; (2) existence being basic, each self-aware individual can grasp his own existence on reflection in his own immediate experience of himself and his situation as a free being in the world; what he finds is not merely a knowing self but a self that fears, hopes believes, wills, and is aware of its need to find a purpose, plan, and destiny in life; (3) but we cannot grasp our existence by thought alone; thus the fact "all men must die" relates to the essence of man but it is necessary to be involved, to draw the conclusion as a person that "I too must die" and experience its impact on our own individual existence; (4) because of the preceding, it is necessary to abandon our attitude of objectivity and theoretical detachment when faced by the problems relating to the ultimate purpose of our own life and the basis of our own conduct; life remains closed to those who take no part in it because it can have no significance; (5) it follows that the existentialist cannot be rationalist in his outlook for this is merely an escape into thought from the serious problems of existence; none of the important aspects of life—failure, evil, sin, folly—nor (in the view of Kierkegaard) even the existence of God or the truth of Christianity—can be proved by reason. "God does not exist; He is eternal," was how he expressed it; (6) life is short and limited in space and time, therefore it is foolish to discuss in a leisurely fashion matters of life or death as if there were all eternity to argue them in. It is necessary to make a leap into the unknown, *e.g.*, accepting Christ (in the case of the Christian existentialist) by faith in the sense of giving and risking the self utterly. This means complete commitment, not a dependence on arguments

as to whether certain historical events did, or did not, happen

To summarise: existentialism of whatever type seems to the outsider to be an attitude to life concerning itself with the individual's ultimate problems (mine, not yours); to be anti-rationalist and anti-idealist (in the sense of being, as it seems to the believer, practical)—in effect it seems to say "life is too short to fool about with argument, you must dive in and become committed" to something. Sartre who calls himself an "atheist existentialist" is apparently committed to the belief that "hell is other people," but for most critics the main argument against existentialist philosophy is that it often rests on a highly specialised personal experience and, as such, is incommunicable.

Extra-sensory Perception. *See* **Telepathy.**

F

Fabian Society. In 1848 (the year of *The Communist Manifesto* by Marx and Engels) Europe was in revolt. In most countries the workers and intellectuals started bloody revolutions against the feudal ruling classes which were no less violently suppressed, hence on the continent socialism took on a Marxist tinge which to some extent it still retains. But at the same time England was undergoing a slow but non-violent transition in her political and industrial life which led the workers in general to look forward to progress through evolution. Marxism never became an important movement in England even though it took its origin here. There were many reasons for this: the agitation of the Chartists (*q.v.*), the writings of Mill, Ruskin, and Carlyle, the reforms of Robert Owen, the religious movement led by the Wesleys, the Co-operative societies, the Christian socialists. Furthermore legislation stimulated by these bodies had led to an extension of the franchise to include a considerable number of wage-earners, remedial measures to correct some of the worst abuses of the factory system, recognition of the trade unions, etc.

This was the background against which the Fabian Society was founded in 1884 with the conviction that social change could be brought about by gradual parliamentary means. (The name is derived from Quintus Fabius Maximus, the Roman general nicknamed "Cunctator," the delayer, who achieved his successes in defending Rome against Hannibal by refusing to give direct battle.) It was a movement of brilliant intellectuals, chief among whom were Sidney and Beatrice Webb, H. G. Wells, G. B. Shaw, Graham Wallas, Sidney Olivier, and Edward Pease. The Society itself was basically a research institution which furnished the intellectual information for social reform and supported all contributing to the gradual attainment by parliamentary means of socialism.

The Webbs's analysis of society emphasised that individualist enterprise in capitalism was a hang-over from early days and was bound to defeat itself since socialism is the inevitable accompaniment of modern industrialism, the necessary result of popular government is control of their economic system by the people themselves. Utopian schemes had been doomed to failure because they were based on the fallacy that society is static and that islands of utopias could be formed in the midst of an unchanging and antagonistic environment. On the contrary, it was pointed out, society develops. "The new becomes old, often before it is consciously regarded as new." Social reorganisation cannot usefully be hastened by violent means but only through methods consonant with this natural historical progression—gradual, peaceful, and democratic. The Fabians were convinced that men are rational enough to accept in their common interest developments which can be demonstrated as necessary, thus public opinion will come to see that socialisation of the land and industries is essential in the same way that they came to accept the already-existing acts in respect of housing, insurance, medical care, and conditions of work. Gradual "permeation" of the power groups—trade unions, political parties, managers, and enlightened employers—would speed the process.

The Society collaborated first in the formation of the Independent Labour Party and then with the more moderate Labour Party and the trade unions and Co-operative movement. But in general it disapproved of independent trade union action since change should come from the government and take political form. The class-war of Marx was rejected and so too was the idea of the exclusive role of the working class—reform must come from the enlightened co-operation of all classes—not from their opposition.

Fabians have not been notably internationalist in their outlook in the sense that they have no permanent affiliations with international socialist bodies and were primarily concerned with progress in Britain. So far as imperialism is concerned they have urged increasing self-government and the training of native populations until they are ready to govern, but this is a gradual process to be accompanied by the improving of social and economic conditions.

Faculty Psychology, a school of psychology, basically belonging to the early 19th cent., which sought to explain mental phenomena by referring them to the activity of certain agencies or faculties such as memory, imagination, will, etc., as if they were entities in their own right rather than merely general terms for various groups of mental phenomena. Its most extreme form was phrenology (*q.v.*) which found no less than thirty-seven so-called faculties.

Falangists. The Fascist Party of Spain founded in 1933 by José Antonio Primo de Rivera, son of the man who was dictator of the country from 1923 to 1930, he was shot by the Republicans. In 1937 the falangists who had shown unwelcome signs of social radicalism were merged with the other right-wing political groups to form the *Falange Española Tradicionalista y de las Juntas de Ofensive Nacional Sindicalistas* which replaced the Cortes (*i.e.* the Government) between 1939 and 1942 when the Cortes was reinstituted. The Falange is the only political party allowed in Spain. *See* **Fascism.**

Fascism. From the end of mediaeval times with the opening up of the world, the liberation of the mind and the release of business enterprise, a new spirit arose in Europe exemplified in such movements as the Renaissance, the Reformation, the struggle for democracy, the rise of capitalism, and the Industrial Revolution. With these movements there developed a certain tradition which, in spite of hindrances and disagreements or failures, was universally held both by right- and left-wing parties however strongly they might fail to agree on the best means of attaining what was felt to be a universal ideal. The hard core of this tradition involved belief in reason and the possibility of human progress, the essential sanctity and dignity of human life, tolerance of widely different religious and political views, reliance on popular government and the responsibility of the rulers to the ruled, freedom of thought and criticism; the necessity of universal education, impartial justice and the rule of law, the desirability of universal peace. Fascism was the negation of every aspect of this tradition and took pride in being so. Emotion took the place of reason, the "immutable, beneficial, and fruitful inequality of classes" and the right of a self-constituted élite to rule them replaced universal suffrage because absolute authority "quick, sure, unanimous" led to action rather than talk. Contrary opinions are not allowed and justice is in the service of the state, war is desirable to advance the power of the state, and racial inequality made a dogma. Those who belong to the "wrong" religion, political party, or race are outside the law.

The attacks on liberalism and exaltation of the state derive largely from Hegel and his German followers, the mystical irrationalism from such 19th cent. philosophers as Schopenhauer, Nietzsche, and Bergson; from Sorel (*see* **Syndicalism**) came the idea of the "myth," and an image which would have the power to arouse the emotions of the masses and from Sorel also the rationale of violence and justification of force.

But these philosophical justifications of fascism do not explain why it arose at all and why it arose where it did—in Italy, Germany, and Spain. These countries had one thing in common—disillusionment Germany had lost the 1914–18 war, Italy had been on the winning side but was resentful about her small gains, Spain had sunk to the level of a third-rate power, and people were becoming increasingly restive under the reactionary powers of the Catholic Church, the landed aristocracy, and the army In Marxist theory, fascism is the last fling of the ruling class and the bourgeoisie in their attempt to hold down the workers

Italian Fascism The corporate state set up by Benito Mussolini in Italy claimed to be neither capitalist nor socialist, and after its inception in 1922 the Fascist Party became the only recognised one. Its members wore black shirts, were organised in military formations, used the Roman greeting of the outstretched arm, and adopted as their slogan "Mussolini is always right." Membership of the Party was not allowed to exceed a number thought to be suited to the optimum size of a governing class and new candidates were drawn, after strict examinations, from the youth organisations The Blackshirts, a fascist militia, existed separately from the army and were ruled by Fascist Headquarters

At the head of government was Mussolini, "Il Duce" himself, a cabinet of fourteen ministers selected by him and approved by the King to supervise the various functions of government, and the Grand Council or directorate of the Fascist Party, all the members of which were chosen by the Duce. Parliament, which was not allowed to initiate legislation but only to approve decrees from above, consisted of a Senate with life-membership and a Chamber of Fasci and Corporations composed of nominated members of the Party, the National Council of Corporations, and selected representatives of the employers' and employees' confederations Private enterprise was encouraged and protected but rigidly controlled, strikes were forbidden, but a Charter of Labour enforced the collaboration of workers and employers whose disputes were settled in labour courts presided over by the Party All decisions relating to industry were government-controlled (*e g*, wages, prices, conditions of employment and dismissal, the expansion or limitation of production), and some industries such as mining, shipping, and armaments were largely state owned

Italian fascism served as a model in other countries, notably for the German National Socialist Party, in Spain and Japan, and most European nations between the wars had their small Fascist parties, the British version led by Sir Oswald Mosley being known as the British Union which advocated the abolition of free speech greater interest in the Commonwealth, and anti-semitism Although fascism in all countries has certain recognisable characteristics, it would be wrong to think of it as an international movement taking fixed forms and with a clearly thought-out rationale as in the case of communism It is doubtful, for example, whether Japanese "fascism" was entitled to be described as such, and the Spanish Falange differs in many respects both in outlook and origins from the German or Italian varieties In fact the word "fascist," like "bolshevik," is often used as a purely emotive term of abuse *See* **Falange, Nazism.**

Fatalism. *See* **Determinism.**

Fetichism, originally a practice of the natives of West Africa and elsewhere of attributing magical properties to an object which was used as an amulet, for putting spells on others, or regarded as possessing dangerous powers In psychology the term refers to a sexual perversion in which objects such as shoes, brassières, hair, etc, arouse sexual excitement

Feudalism. The feudal system took its origins from Saxon times and broadly speaking lasted until the end of the 13th cent. It was a military and political organisation based on land tenure, for, of course, society throughout this period was based almost entirely on agriculture The activities of men divided them into three classes or estates. The First Estate was the clergy, responsible for man's spiritual needs; the Second was the nobility, including kings and emperor as well as the lesser nobles, the Third was composed of all those who had to do with the economic and mainly agricultural life of Europe The praying men, the fighting men and administrators, and the toilers were all held to be dependent on each other in a web of mutual responsibilities

The theory of feudalism, although it by no means always worked out in practice, was as follows the earth was God's and therefore no man owned land in the modern sense of the word God had given the pope spiritual charge of men, and secular power over them to the emperor from whom kings held their kingdoms, and in turn the dukes and counts received the land over which they held sway from the king. Members of the Second Estate held their lands on the condition of fulfilling certain obligations to their overlord and to the people living under them, so when a noble received a fief or piece of land he became the vassal of the man who bestowed it To him he owed military service for a specified period of the year, attendance at court, and giving his lord counsel He undertook to ransom his lord when he fell into enemy hands and to contribute to his daughter's dowry and at the knighting of his son In return the lord offered his vassal protection and justice, received the vassal's sons into his household and educated them for knighthood

The system was complicated by the fact that large fiefs might be subdivided and abbots often governed church lands held in fief from nobles The serf or toiling man dwelt on the land of a feudal noble or churchman where he rendered service by tilling the soil or carrying out his craft for his manorial lord in return for protection, justice, and the security of his life and land He was given a share in the common lands or pastures from which he provided for his own needs In the modern sense he was not free (although at a later stage he could buy his freedom) since he was attached to the soil and could not leave without the lord's permission On the other hand he could neither be deprived of his land nor lose his livelihood Feudal tenures were abolished in England by statute in 1660, although they had for long been inoperative In Japan a feudal system existed up to 1871, in Russia until 1917, and many relics of it still linger on (*e g* the *mezzadria* system of land tenure in parts of Italy)

Fourierism. *See* **Utopianism.**

Freemasonry, a secret organisation with different systems in different countries It shares with other secret societies the characteristics of being secret, having signs by which one fellow-member can recognise another, initiation ceremonies, peculiar regalia, and various grades of enlightenment In England freemasonry was first organised in 1717 and in France and Germany in 1725 and 1737 respectively Masons claim to be working for the good of mankind, and carry out various charitable works Many notable people are in the movement Whatever their beliefs there can be no doubt that on the continent freemasons have intervened in politics and the organisation is banned by the Roman Catholic Church Absurd attempts have been made (and quite possibly are part of Masonic belief) to trace the society back to early and even Biblical times Historically, of course, this is absurd, nor have freemasons any connection with the masons' guilds of the Middle Ages which were intended for masons in the ordinary sense of the word

Freudian theory. *See* **Section F, Part III.**

Friends, The Society of, or Quakers, a religious body founded in England in the 17th cent. by George Fox (1624–91) The essence of their faith is that every individual who believes has the power of direct communication with God who will guide him into the ways of truth This power comes from the "inner light" of his own heart, the light of Christ. Quakers meet for worship avoiding all ritual, without ordained ministers or prepared sermons, there is complete silence until someone is moved by the Holy Spirit to utter his message

In the early days Quakers gave vent to

violent outbursts and disturbed church services Friends had the habit of preaching at anyone who happened to be nearby, their denunciation of "steeple-houses" and references to the "Inner light," their addressing everyone as "thee" and "thou," their refusal to go beyond "yea" and "nay" in making an assertion and refusing to go further in taking an oath, must have played some part in bringing about the savage persecutions they were forced to endure. Many emigrated to Pennsylvania, founded by William Penn in 1682, and missionaries were sent to many parts of the world. The former violence gave way to gentleness. Friends not only refused to take part in war but even refused to resist personal violence. They took the lead in abolishing slavery, worked for prison reform and better education As we know them today Quakers are quiet, sincere, undemonstrative people, given to a somewhat serious turn of mind The former peculiarities of custom and dress have been dropped and interpretation of the Scriptures is more liberal Although Quakers refuse to take part in warfare, they are always ready to help the victims of war, by organising relief, helping refugees in distress, or sending their ambulance units into the heat of battle

G

Gestalt Psychology. Whilst Behaviourism (*q v*) was emerging in America a new school of thought was arising in Germany which has revolutionised the outlook of psychology in certain fields and is one of the most important schools of today Basically dealing with problems of perception and learning, it took issue with the old concept of the **Associationists** (*q v*) that mental life was based on the "association of ideas," and one of the doctrines of the Behaviourists and others that learning is based either on a process of trial and error or conditioning The three founders of the school were Max Wertheimer, Wolfgang Köhler, and Kurt Koffka who named it the Gestalt school—a German word which is retained because it had no definite English counterpart but may roughly be translated as "pattern" or "configuration" They meant by this that the human mind has a natural tendency to find significant patterns among sensations, contrary to the Associationist view that initially we simply experience atomised elements which we later learn to associate together as an object The latter was described by the new school as a "brick and mortar" psychology which explained where the bricks came from but failed to explain the mortar which makes the elements a whole (The whole is not the mere sum of its parts) Thus a tune is made up from notes in a scale but is not present in them individually, and the tune is still present if we change the key using entirely different notes. Pattern and relationships which have significance are at the basis of mental activity, especially in learning Thus experiments have shown that if hens are presented with grain laid on both white and grey pieces of paper and are allowed to eat from the grey but are shooed away from the white, they soon learn to go to the grey piece only This, the Associationists would say, is a perfect example of the association of ideas white equals punishment, grey equals food, so naturally the paper associated with food wins But Köhler did a further experiment and substituted black for the white paper If the theory of association were correct, the hens would still feed at the grey paper which they had learned to associate with food In fact, they went to the grain on the black paper The obvious explanation was that the birds were not responding to a simple association, grey equals food, but to the relationship "darker than." They took in the whole situation, not just parts of it

Similarly the Behaviourist theory of learing was one of conditioning—the dog presented with food preceded by a whistle soon begins to salivate at the whistle alone. Other psychologists emphasised the process of trial and error showing, for example, that a cat placed in a box which could only be opened by a latch or by pulling a wire loop to reach a plate of food outside, at first made completely random movements until by chance the correct one happened to be made. On subsequent occasions the random element grew less and less and thus the cat ultimately learned to go straight for the latch But Kohler criticised these experiments (without denying that some learning may be by either conditioning or trial and error) by pointing out that in most of the trial and error experiments where mazes or puzzle boxes were used the *whole situation* was not open to the animal's inspection. An important element in learning, even in animals, is insight Thus a dog separated from food by a length of fencing will almost immediately run around the fence provided it can see its ends A chimpanzee with a banana outside its cage and a suitable stick inside within the same field of vision will soon use it to poke the fruit inside But if the stick is lying at the back of the cage the absence of a compact visual pattern of stick and banana will likely cause it to fail Gestalt, in short, emphasises the pattern-finding and significance-seeking tendencies of the mind and its ability to learn by insight. It has also criticised the type of personality test which lists individual traits, giving the subject a rating for each trait, on the ground that such tests do not show the function of each trait in the total personality which is an organised whole rather than the sum of its individual characteristics

Gnosticism. Among the many heresies of early Christianity, especially during its first two centuries, was a group which came under the heading of Gnosticism This was a system or set of systems which attempted to combine Christian beliefs with others derived from Oriental and Greek sources, especially those which were of a mystical and metaphysical nature, such as the doctrines of Plato and Pythagoras There were many Gnostic sects, the most celebrated being the Alexandrian school of Valentinus (fl *c* 136–*c* 160) "Gnosis" was understood not as meaning "knowledge" or "understanding" as we understand these words, but "revelation" As in other mystical religions, the ultimate object was individual salvation; sacraments took the most varied forms. Many who professed themselves Christians accepted Gnostic doctrines and even orthodox Christianity contains some elements of Gnostic mysticism It was left to the bishops and theologians to decide at what point Gnosticism ceased to be orthodox and a difficult task this proved to be Two of the greatest, Clement of Alexandria and his pupil Origen, unwittingly slipped into heresy when they tried to show that such men as Socrates and Plato, who were in quest of truth were Christian in intention, and by their lives and works had prepared the way for Christ Thus they contradicted Church doctrine which specifically said *Extra ecclesiam nulla salus*—outside the Church there is no salvation

God and Man. The idea of gods came before the idea of God and even earlier in the evolution of religious thought there existed belief in spirits (*see* **Animism**) It was only as a result of a long period of development that the notion of a universal "God" arose, a development particularly well documented in the Old Testament Here we are concerned only with the views of philosophers, the views of specific religious bodies being given under the appropriate headings First, however, some definitions

Atheism is the positive disbelief in the existence of a God **Agnoticism** (a term coined by T. H Huxley, the 19th cent. biologist and contemporary of Darwin) signifies that one cannot know whether God exists or not. **Deism** is the acceptance of the existence of God, not through revelation, but as a hypothesis required by reason **Theism** also accepts the existence of God, but, unlike Deism, does not reject the evidence of revelation (*e g*, in the Bible or in the lives of the saints). **Pantheism** is the identification of God with all that exists (*i e*, with the whole universe) **Monotheism** is the belief in one God, **Polytheism** the belief in many (*see also* **Dualism**).

Early Greek Views Among the early Greek philosophers, Thales (*c.* 624–565 B C.) of Miletus,

in Asia Minor, Anaximander (611-547 B C), his pupil, and Anaxemenes (b c 570 B C), another Miletan, were men of scientific curiosity and their speculations about the origin of the universe were untouched by religious thought They were basically materialist and atheist in thought Heraclitus of Ephesus (c 540-475 B C), the philosopher of change, and the founder of metaphysics, was scornful of the popular religion of his day For him fire was the prime element—the *Logos*—the most complete embodiment of the process of Becoming Empedocles of Agrigentum in Sicily (c 500-c 430 B C) introduced the idea of opposition and affinity All matter is composed of the so-called four elements—*earth, water, air,* and *fire*—which are in opposition or alliance with each other All these were materialist philosophers who sought to explain the working of the universe without recourse to the gods

Socrates, Plato, and Aristotle. Socrates (470-399 B C) was primarily concerned with ethical matters and conduct rather than the nature of the universe For him goodness and virtue come from knowledge He obeyed an " inner voice " and suffered death rather than give up his philosophy. He believed in the persistence of life after death and was essentially a monotheist Plato (427-347 B C) was chiefly concerned with the nature of reality and thought in terms of absolute truths which were unchanging, logical, and mathematical (*See* **Mind and Matter.**) Aristotle (384-322 B C) took his view of matter not from Democritus (atomic view) but from Empedocles (doctrine of four elements), a view which came to fit in well with orthodox mediaeval theology Matter is conceived of as potentially alive and striving to attain its particular form, being moved by divine spirit or mind (*nous*). (An acorn, for example, is matter which contains the form " oak-tree " towards which it strives) Thus there is a whole series from the simplest level of matter to the perfect living individual But there must be a supreme source of all movement upon which the whole of Nature depends, a Being that Aristotle describes as the " Unmoved Mover," the ultimate cause of all becoming in the universe This Being is pure intelligence, a philosopher's God, not a personal one Unlike Plato, Aristotle did not believe in survival after death, holding that the divine, that is the immortal element in man, is mind

Among the later Greek thinkers the Epicureans were polytheists whose gods, however, were denied supernatural powers. The Stoics built up a materialist theory of the universe, based on the Aristotelian model To them God was an all-pervading force, related to the world as the soul is related to the body, but they conceived of it as material They developed the mystical side of Plato's idealism and were much attracted by the astrology coming from Babylonia They were pantheists The Sceptics were agnostics

From Pagan to Christian Thought Philo, " the Jew of Alexandria," who was about 20 years older than Jesus, tried to show that the Jewish scriptures were in line with the best in Greek thought. He introduced the *Logos* as a bridge between the two systems Philo's God is remote from the world, above and beyond all thought and being, and as His perfection does not permit direct contact with matter the divine *Logos* acts as intermediary between God and man. Plotinus (204-70), a Roman, and the founder of Neoplatonism, was the last of the great pagan philosophers Like Philo, he believed that God had created the world indirectly through emanations—beings coming from Him but not of Him The world needs God but God does not need the world Creation is a fall from God, especially the human soul when enmeshed in the body and the world of the senses, yet (*see* **Determinism**) man has the ability to free himself from sense domination and turn towards God Neoplatonism was the final stage of Greek thought drawing its inspiration from the mystical side of Plato's idealism and its ethics from Stoicism

Christianity · The Fathers and the Schoolmen It was mainly through St. Augustine (354-430), Bishop of Hippo in North Africa, that certain of the doctrines of Neoplatonism found their way into Christianity. Augustine also emphasised the concept of God as all good, all wise, all knowing, transcendent, the Creator of the universe out of nothing But, he added, since God knows everything, everything is determined by Him forever This is the doctrine of predestination and its subsequent history is discussed under **Determinism.**

In the early centuries of Christianity, as we have seen, some found it difficult to reconcile God's perfection with His creation of the universe and introduced the concept of the *Logos* which many identified with Christ Further, it came to be held that a power of divine origin permeated the universe, namely the Holy Spirit or Holy Ghost Some theory had to be worked out to explain the relationships of these three entities whence arose the conception of the Trinity God is One, but He is also Three Father, Son (the *Logos* or Christ), and Holy Ghost

This doctrine was argued by the Apologists and the Modalists The former maintained that the *Logos* and the Holy Spirit were emanations from God and that Jesus was the *Logos* in the form of a man The Modalists held that all three Persons of the Trinity were God in three forms or modes the *Logos* is God creating, the Holy Spirit God reasoning, and God is God being This led to a long discussion as to whether the *Logos* was an emanation from God or God in another form, was the *Logos* of like *nature* with God or of the same *substance?* This was resolved at the Council of Nicaea (325) when Athanasius formulated the orthodox doctrine against Arius (*q v*) that the one Godhead is a Trinity of the same substance, three Persons of the same nature—Father, Son, and Holy Ghost

St Thomas Aquinas (1227-74), influenced greatly by Aristotle's doctrines, set the pattern for all subsequent Catholic belief even to the present time He produced rational arguments for God's existence · *e g*, Aristotle's argument that, since movement exists, there must be a prime mover, the Unmoved Mover or God, further, we can see that things in the universe are related in a scale from the less to the more complex, from the less to the more perfect, and this leads us to suppose that at the peak there must be a Being with absolute perfection God is the first and final cause of the universe, absolutely perfect, the Creator of everything out of nothing He reveals Himself in his Creation and rules the universe through His perfect will. How Aquinas dealt with the problem of predestination is told under **Determinism.**

Break with Mediaeval Thought Renaissance thinkers, free to think for themselves, doubted the validity of the arguments of the Schoolmen but most were unwilling to give up the idea of God (nor would it have been safe to do so) Mystics (*see* **Mysticism**) or near-mystics such as Nicholas of Cusa (c 1401-64) and Jacob Boehme (1575-1624) taught that God was not to be found by reason but was a fact of the immediate intuition of the mystical experience Giordano Bruno held that God was immanent in the infinite universe He is the unity of all opposites, a unity without opposites, which the human mind cannot grasp Bruno was burned at the stake in 1600 at the instigation of the Inquisition (a body which, so we are told, never caused pain to anyone since it was the civil power, not the Inquisition, that carried out the unpleasant sentences) for his heresy

Francis Bacon, who died in 1626, separated, as was the tendency of that time, science from religion The latter he divided into the two categories of natural and revealed theology The former, through the study of nature, may give convincing proof of the existence of a God but nothing more Of revealed theology he said " we must quit the small vessel of human reason as we are obliged to obey the divine law, though our will murmurs against it, so we are obliged to believe in the word of God, though our reason is shocked at it " Hobbes (d 1679) was a complete materialist and one feels that obeisance to the notion was politic rather than from conviction However, he does mention God as starting the universe in motion,

infers that God is corporeal, but denies that His nature can be known.

From Descartes Onwards Descartes (1596–1650) separated mind and body as different entities but believed that the existence of God could be deduced by the fact that the idea of him existed in the mind Whatever God puts into man, including his ideas, must be real God is self-caused, omniscient, omnipotent, eternal, all goodness and truth But Descartes neglected to explain how mind separate from body can influence body, or God separate from the world can influence matter

Spinoza (1632–77) declared that all existence is embraced in one substance—God, the all-in-all He was a pantheist and as such was rejected by his Jewish brethren But Spinoza's God has neither personality nor consciousness, intelligence nor purpose, although all things follow in strict law from His nature All the thought of everyone in the world, make up God's thoughts

Bishop Berkeley (1685–1753) took the view that things exist only when they are perceived, and this naturally implies that a tree, for example, ceases to exist when nobody is looking at it This problem was solved to his own satisfaction by assuming that God, seeing everything, prevented objects from disappearing when we were not present The world is a creation of God but it is a spiritual or mental world, not a material one

Hume (1711–76), who was a sceptic, held that human reason cannot demonstrate the existence of God and all past arguments to show that it could were fallacious. Yet we must believe in God since the basis of all hope, morality, and society is based upon the belief Kant (1724–1804) held a theory similar to that of Hume We cannot know by reason that God exists, nor can we prove on the basis of argument anything about God But we can form an idea of the whole of the universe, the one Absolute Whole, and personify it We need the idea of God on which to base our moral life, although this idea of God is transcendent, *i e*, goes beyond experience

William James (1842–1910), the American philosopher (*see* **Pragmatism**), held much the same view God cannot be proved to exist, but we have a will to believe which must be satisfied, and the idea works in practice Hegel (1770–1831) thought of God as a developing process, beginning with "the Absolute" or First Cause and finding its highest expression in man's mind, or reason It is in man that God most clearly becomes aware of Himself Finally Comte (1798–1857), the positivist, held that religion belongs to a more primitive state of society and, like many modern philosophers, turned the problem over to believers as being none of the business of science

Good and Evil.

Early Philosophers' Views The early Greek philosophers were chiefly concerned with the laws of the universe, consequently it was common belief that knowledge of these laws, and living according to them, constituted the supreme good Heraclitus, for example, who taught that all things carried with them their opposites, held that good and evil were like two notes in a harmony, necessary to each other "It is the opposite which is good for us" Democritus, like Epicurus (*q v*), held that the main goal of life is happiness, but happiness in moderation The good man is not merely the one who *does* good but who always *wants* to do so "You can tell the good man not by his deeds alone but by his desires" Such goodness brings happiness, the ultimate goal On the other hand, many of the wandering Sophist teachers taught that good was merely social convention, that there are no absolute principles of right and wrong, that each man should live according to his desires and make his own moral code To Socrates knowledge was the highest good because doing wrong is the result of ignorance "no man is voluntarily bad" Plato and Aristotle, differing in many other respects, drew attention to the fact that man is composed of three parts, his desires and appetites, his will, and his reason A man whose reason rules his will and appetites is not only a good but a happy man; for happiness is not an aim in itself but a by-product of the good life Aristotle, however, emphasised the goal of self-realisation, and thought that if the goal of life is (as Plato had said) a rational attitude towards the feelings and desires, it needs to be further defined Aristotle defined it as the "Golden Mean"—the good man is one who does not go to extremes but balances one extreme against another Thus courage is a mean between cowardice and foolhardiness The later philosophers Philo and Plotinus held that evil was in the very nature of the body and its senses Goodness could only be achieved by giving up the life of the senses and, freed from the domination of the body, turning to God, the source of goodness.

Christian Views St Augustine taught that everything in the universe is good Even those things which appear evil are good in that they fit with the harmony of the universe like shadows in a painting Man should turn his back on the pleasures of the world and turn to the love of God Peter Abelard (1079–1142) made the more sophisticated distinction when he suggested that the wrongness of an act lies not in the act itself, but in the intention of the doer "God considers not what is done but in what spirit it is done, and the merit or praise of the agent lies not in the deed but in the intention" If we do what we believe to be right, we may err, but we do not sin The only sinful man is he who deliberately sets out to do what he knows to be wrong St Thomas Aquinas agreed with Aristotle in that he believed the highest good to be realisation of self as God has ordained, and he also agreed with Abelard that intention is important Even a good act is not good unless the doer intended it to have good consequences Intention will not make a bad act good, but it is the only thing that will make a good act genuinely good

In general, Christianity has had difficulties in solving the problem of the existence of evil, for even when one accepts that the evil men do is somehow tied up with the body, it is still difficult to answer the question how could an all-good God create evil? This is answered in one of two ways (*a*) that Adam was given free-will and chose to sin (an answer which still does not explain how sin could exist anywhere in the universe of a God who created everything), (*b*) by denying the reality of evil as some Christians have chosen to do (*e g*, Christian Science *q v*) The Eastern religions, on the other hand (*see* **Zoroastrianism**), solved the problem in a more realistic way by a dualism which denied that their gods were the creators of the whole universe and allowed the existence of at least two gods, one good and one evil In Christianity there is, of course, a Devil, but it is not explained whence his evil nature came

Later Philosophic Views Hobbes equated good with pleasure, evil with pain They are relative to the individual man in the sense that "one man's meat is another man's poison" Descartes believed that the power to distinguish between good and evil given by God to man is not complete, so that man does evil through ignorance We act with insufficient knowledge and on inadequate evidence Locke, believing that at birth the mind is a blank slate, held that men get their opinions of right and wrong from their parents By and large, happiness is good and pain is evil But men do not always agree over what is pleasurable and what not Hence laws exist and these fall into three categories: (1) the divine law, (2) civil laws, (3) matters of opinion or reputation which are enforced by the fact that men do not like to incur the disapproval of their friends We learn by experience that evil brings pain and good acts bring pleasure, and, basically, one is good because not to be so would bring discomfort

Kant (*see* **God and Man**) found moral beliefs to be inherent in man whether or not they can be proved by reason There is a categorical imperative which makes us realise the validity of two universal laws (1) "always act in such a way that the maxim determining your conduct might well become a universal law, act so that you can will that everybody shall follow the

principle of your action ". (2) " always act so as to treat humanity, whether in thine own person or in that of another, in every case as an end and never as a means "

Schopenhauer (1788–1860) was influenced by Buddhism and saw the will as a blind impelling striving, and desire as the cause of all suffering The remedy is to regard sympathy and pity as the basis of all morality and to deny one's individual will This is made easier if we realise that everyone is part of the Universal Will and therefore the one against whom we are struggling is part of the same whole as ourselves

John Stuart Mill and Jeremy Bentham were both representatives of the Utilitarian school, believing that good is the greatest good (happiness) of the greatest number (*see* **Utilitarianism**) Lastly, there is the view held mostly by political thinkers that good is what is good for the state or society in general (*see* **State and Man**)

Guild Socialism, a British form of syndicalism (*q v*) created in 1906 by an architect, A. J Penty, who was soon joined by A R Orage, S G Hobson, and G D H Cole The background to the movement was the situation that, although at that time the Labour Party had 29 members in the House of Commons, a period of severe economic crisis had shown the government unwilling and the Labourites unable to do anything about it, the workers were resorting again to direct action to secure their demands and the democratic and constitutional methods to which the Fabians had partly persuaded them seemed to have failed The guild socialists advocated a restoration of the mediaeval guild system as was being recommended by the French syndicalists whose programme involved a return to direct economic action, a functional industrial structure, return of craftsmanship, and distrust of the state Guild socialists believed that value was created by society as a whole rather than by individuals singly, and that capitalist economists had recommended the acquisition of wealth without emphasising the social responsibilities which wealth should bring The trade unions were to be organised to take over and run their own industries after nationalisation Thus guild socialists were not only against capitalism but also against state socialism in which the state took over the control of industry Political authority was held to be uncongenial to human freedom and therefore nothing was to be gained by the substitution of state bureaucracy for capitalist control The National Guilds League, formed in 1915, advocated the abolition of the wages system, self-government in industry, control by a system of national guilds acting in conjunction with other functional democratic organisations in the community This body was dissolved in 1925, but the theories of guild socialism are often referred to by British Labour Party theorists and have undoubtedly influenced British socialism

H

Hinduism, the religion and social institutions of the great majority of the people of India Hinduism has no fixed scriptural canon but its doctrines are to be found in certain ancient works, notably the *Veda*, the *Brahmanas*, the *Upanishads*, and the *Bhagavad-gita* The dark-skinned Dravidians invaded India between about 3250 and 2750 B C and established a civilisation in the Indus valley. They were polytheists who worshipped a number of nature-gods; some elements of their beliefs persisted into Hinduism They were subdued by a light-skinned Nordic people who invaded from Asia Minor and Iran about 1500 B.C The language of these Aryan people was Vedic, parent of Sanskrit in which their religious literature (the Vedas) came to be written after many centuries of oral transmission.

The *Veda* or Sacred Lore has come down to us in the form of mantras or hymns of which there are four great collections, the best-known being the *Rig-Veda* These Vedic Aryans worshipped nature-deities, their favourites being Indra (rain), Agni (fire), and Surya (the sun) Their religion contained no idolatry but became contaminated by the more primitive beliefs of the conquered Dravidians Sacrifice and ritual became predominant in a ceremonial religion.

As a reaction a more philosophic form arose (*c.* 500 B C) with its scriptures in the *Upanishads* At its highest level, known as Brahmanism, belief is in a subtle and sophisticated form of monotheism (*Brahma* is an impersonal, all-embracing spirit), but there is a tolerant acceptance of more primitive beliefs. Thus Vishnu (a conservative principle) and Siva (a destructive principle) grew out of Vedic conceptions. The two great doctrines of Hinduism are *karma* and transmigration The universal desire to be reunited with the absolute (the *Atman* or *Brahma*) can be satisfied by following the path of knowledge Life is a cycle of lives (*samsara*) in which man's destiny is determined by his deeds (*karma*) from which he may seek release (*moksa*) through ascetic practices or the discipline of **Yoga** (*q v*). Failure to achieve release means reincarnation—migration to a higher or lower form of life after death—until the ultimate goal of absorption in the absolute is reached

In the great Sanskrit epic poems *Ramayana* and *Mahabharata* the deity takes three forms, represented by the divine personalities of Brahma, Vishnu, and Siva There are also lower gods, demi-gods, supernatural beings, and members of the trinity may even become incarnate, as Vishnu became identified with Krishna, one of the heroes of the *Mahabharata* and the well-known *Bhagavad-gita*

The ritual and legalistic side of Brahmanism is the caste system based on the elaborate codes of the *Law of Manu*, according to which God created distinct orders of men as He created distinct species of animals and plants Men are born to be Brahmans, soldiers, agriculturists, or servants, but since a Brahman may marry a woman from any of these castes, an endless number of sub-castes arises

Hinduism has always shown great tolerance for varieties of belief and practice Ideas pleasant and unpleasant have been assimilated fetichism, demon-cults, animal-worship, sexual-cults (such as the rites of *Kali* in Calcutta) For the majority of the peoples of India there has been little but spiritual fear " They take the good things for granted but demons lurk everywhere although they inhabit mostly the seven upper worlds nearest our own or the twenty-one hells beneath " The educated Hindu, of course, does not share these beliefs for him there is but one God and the many forms are merely the images He takes Today, as would be expected in a country which is in the throes of vast social change, Hinduism itself is changing Under the impact of modern conditions new ideas are destroying old beliefs and customs *See also* **Jainism, Sikhism.**

Humanism, the term applied to (1) a system of education based on the Greek and Latin classics, and (2) the vigorous attitudes that accompanied the end of the Middle Ages and were represented at different periods by the Renaissance, the Reformation, the Industrial Revolution, and the struggle for democracy These include release from ecclesiastical authority, the liberation of the intellect, faith in progress, the belief that man himself can improve his own conditions without supernatural help and, indeed, has a duty to do so " Man is the measure of all things " is the keynote of humanism

Humanitarianism refers to the attempt to deal with the hardships of others, with particular reference to those who suffered under the conditions accompanying the early stages of the Industrial Revolution.

Humanity, Religion of. *See* **Positivism.**

Hussites, the followers of John Hus, the most famous pupil of John Wyclif He was the rector of Prague University and, although it is now by no means certain that his beliefs were heretical, he was condemned to death for heresy and burnt at the stake in 1415 at Constance whence he had come with a safe conduct issued by the Emperor Sigismund of Hungary The latter based his action on the doctrine that no faith need be kept with heretics, but it is obvious that the main objection to Hus was his

contempt for authority of any kind. After their leader's death the Hussites became a formidable body in Bohemia and Moravia. They took up arms on behalf of their faith, their religion being strongly imbued with political feeling (hostility to Germanism and to the supremacy of the Roman Church). Their religious struggles for reform led to the Hussite Wars during which the movement splintered into several groups.

I

conoclast heresy. In 726 the Byzantine Emperor Leo issued a decree condemning the use of all images in worship—a decree which was regarded as heretical not only throughout the West, but by a large party in the Eastern Empire. This the popes condemned and in 787 the East abandoned the heresy. Thus in the end the worshippers of images triumphed and the sacred pictures (icons) have remained to this day. Although this controversy is often given as the reason for the absence of statues in the Eastern Churches there is no evidence that they existed to any extent even before the subject arose. Nor had the issue much to do with the break between Constantinople and Rome, since for nearly half of the five centuries between the accession of Constantine and the council of 787 there had been almost no communion between the two Churches.

dealism, in a philosophical sense, the belief that there is no matter in the universe, that all that exists is mind or spirit. *See* **Mind and Matter** and **Realism.**

mmaculate Conception, one of the important dogmas concerning the Blessed Virgin Mary, as taught by the Roman Catholic Church, is that she was conceived and born without original sin (according to a bull of Pius IX, 1854). Christians in general believe in the immaculate conception of Jesus Christ.

mmortality. The belief in a life after death has been widely held since the earliest times. It has certainly not been universal, nor has it always taken a form which everyone would find satisfying. In the early stages of human history or prehistory everything contained a spirit (*see* **Animism**) and it is obvious from the objects left in early graves that the dead were expected to exist in some form after death. The experience of dreams, too, seemed to suggest to the unsophisticated that there was a part of man which could leave his body and wander elsewhere during sleep. In order to save space, it will be helpful to classify the various types of belief which have existed in philosophical thought regarding this problem. (1) There is the idea that, although *something* survives bodily death, it is not necessarily eternal. Thus most primitive peoples were prepared to believe that man's spirit haunted the place around his grave and that food and drink should be set out for it, but that this spirit did not go on forever and gradually faded away. (2) The ancient Greeks and Hebrews believed for the most part that the souls of the dead went to a place of shades there to pine for the world of men. Their whining ghosts spent eternity in a dark, uninviting region in misery and remorse. (3) Other people, and there were many more of these, believed in the transmigration of souls with the former life of the individual determining whether his next life would be at a higher or lower level. Sometimes this process seems to have been thought of as simply going on and on, by others (*e.g.*, in Hinduism and Buddhism) as terminating in either non-sentience or union with God but in any case in annihilation of the self as self. Believers in this theory were the Greek philosophers Pythagoras, Empedocles, Plato (who believed that soul comes from God and strives to return to God, according to his own rather confused notions of the deity. If it fails to free itself completely from the body it will sink lower and lower from one body to another.) Plotinus held similar views to Plato, and many other religious sects in addition to those mentioned have believed in transmigration. (4) The belief of Plato and Aristotle that if souls continue to exist after death there is no reason why they should not have existed before birth (this in part is covered by (3)), but some have pointed out that eternity does not mean "from now on," but the whole of time before and after "now"—nobody, however, so far as one knows, held that *individual* souls so exist. (5) The theory that the soul does not exist at all and therefore immortality is meaningless: this was held by Anaximenes in early Greek times, by Leucippus, Democritus, and the other Greek atomists; by the Epicureans from the Greek Epicurus to the Roman Lucretius, by the British Hobbes and Hume, by Comte of France, and William James and John Dewey of America. (6) The thesis, held notably by Locke and Kant, that although we cannot prove the reality of soul and immortality by pure reason, belief in them should be held for moral ends. (For the orthodox Christian view *see* **God and Man, Determinism and Free-will.**) From this summary we can see that many philosophies and religions (with the important exceptions of Islam and Christianity) without denying a future life do deny the permanence of the individual soul in anything resembling its earthly form (*see* **Spiritualism, Psychic research**).

Imperialism, the practice by a country, which has become a nation and embarked upon commercial and industrial expansion, of acquiring and administering territories, inhabited by peoples usually at a lower stage of development, as colonies or dependencies. Thus the "typical" imperialist powers of the 19th cent. and earlier were Britain, Belgium, Holland, Spain, and Portugal, whilst Germany, Italy, and Japan, which either did not have unity during this period or adequate industrial expansion, tried to make good their lacks in this direction by war in the 20th cent. The term "imperialism" is not easy to define today (although often enough used as a term of abuse). Many people accuse the Soviet Union of imperialism—not only because she does not permit free elections in her satellites, but also because she still holds the vast Asiatic empire acquired by the Tsars in times past. There is also what may be described as economic imperialism exerted, not through armies, but through economic penetration and here America is by no means guiltless. The Afrikaners in South Africa pass laws to permit the exploitation of the Black and Coloured peoples in their midst. Israel, too, whatever one may think of its creation on humanitarian grounds, is surely a piece of land taken from the Arabs who formed 90 per cent of its population, by a people whose only rational claim is that their ancestors lived there two thousand years ago. Imperialism is a dangerous word and, before using it, we would do well to remember the retort of a British statesman who, when lecturing in America prior to Indian independence, was asked by an elderly matron: "What are you going to do about the Indians?" "Which Indians, madam—ours or yours?"

Individual Psychology. The term is applied to the psychological system of Alfred Adler of Vienna (1870–1937) who, together with C. G. Jung (*see* **Analytical Psychology**), broke with Freud in 1911. Adler's system of psychotherapy is based on the idea, not of sex as a driving force as in the case of Freud, but on the concept of "compensation" or a drive for power in an attempt to overcome the "inferiority complex" which he held to be universal in human beings. The child naturally feels inferior to adults, but bullying, making him feel insignificant or guilty or contemptible, even spoiling, which makes him feel important within the family but relatively unimportant outside, increases this feeling. So may the birth of another child who seems to get more attention, or the position of being an only child. Or the child may have physical defects: he may be small or underweight, have to wear glasses, become lame, be constantly ill, or stupid at school. In these ways he develops a sense of inferiority which for the rest of his life he develops a technique to overcome.

This may be done in several ways: he may try to become capable in the very respects in which he feels incompetent—hence many great orators have originally had speech defects, many painters poor eyesight, many musicians been

partially deaf, like Nietzsche, the weakling, he may write about the superman, or like Sandow, the strong man be born with poor health

On the other hand he may overdo his attempt and overcompensate. Hence we have the bully who is really a coward, the small man who is self-assertive to an objectionable degree (Hitler, Napoleon, Stalin, and Mussolini were all small men) or the foreigner who like three of these men wanted to be the hero of their adopted country—Hitler the Austrian, Napoleon the Italian, Stalin the Georgian

But what about the man who can do none of these things, who continues to fail to compensate? He, says Adler, becomes a neurotic because neurosis is an excuse which means "I could have done so-and-so but . . ." It is the unconscious flight into illness—the desire to be ill Thus a man who used to have a good job lost it through no fault of his own and developed a "nervous break-down," one of the symptoms of which was a fear of crossing streets Adler would have asked: "What purpose is served by this symptom?" "Why does he unconsciously not want to cross streets?" The answer was that he had only been offered inferior jobs, and although he felt for his family's sake that he ought to take them, something inside said "No, I have been an important man and I cannot bear to do insignificant work—if I am unable to cross streets I am unable (through no fault of my own) to go out to work" Adler's treatment involves disclosing these subterfuges we play on ourselves so that we can deal with the real situation in a more realistic way The criticism of Adler's theory is not that it is not true It is But it is not the whole truth, for people are much more subtle than Adler gave them credit for. Freud recognised this element of "secondary gain" in neurosis but he knew that there was more to it than that Nevertheless Adler's method works well in some simpler cases

Islam, the religion of which Mohammed (570–632) was the prophet, the word signifying submission to the will of God It is one of the most widespread of religions Its adherents are called Moslems or Muslims Islam came later than the other great monotheistic religions (Judaism and Christianity) and may be regarded in some respects as a heresy. Mohammed accepted the inspiration of the Old Testament and claimed to be a successor to Moses, and although he did not recognise Jesus as God, he did recognise Him as a prophet (*see* **Docetism**)

The sacred book of Islam is the Koran, the most influential book in the world next to the Bible According to Islamic belief the words were revealed to the prophet by God through the angel Gabriel at intervals over a period of 20 years, first at his native Mecca and then at Medina The book is divided into 114 *suras* or chapters all but one begin with the words "In the name of Allah, the Merciful, the Compassionate" It is written in classical Arabic, and Moslems memorise much or all of it The Koran superseded the Gospel as Mohammed superseded Christ Its ethical teachings are high

The great advantage of Mohammedism is that, like orthodox Judaism, it is a literal-minded religion lived in everyday life No Moslem is in any doubt as to exactly how he should carry on in the events of his day He has five duties (1) Once in his life he must say with absolute conviction "There is no God but Allah, and Mohammed is His Prophet" (2) Prayer preceded by ablution must be five times daily—on rising, at noon, in mid-afternoon, after sunset, and before retiring The face of the worshipper is turned in the direction of Mecca (3) The giving of alms generously, including provisions for the poor (4) The keeping of the fast of Ramadan, the holy month, during which believers in good health may neither eat nor drink nor indulge in worldly pleasures between sunrise and sunset (5) Once in his life a Moslem, if he can, must make the pilgrimage to Mecca In addition, drinking, gambling, and the eating of pork are forbidden and circumcision is practised Polygamy is permitted, although decreasing; sexual relations outside marriage are disapproved of, marriage is only with the wife's consent; and divorce may be initiated by either husband or wife A great advantage in the spread of Islam has been its lack of race prejudice

Mohammed's main achievements were the destruction of idolatry, the welding of warring tribes into one community, the progress of a conquest which led after his death to the great and cultured empire which spread throughout the Middle East into north Africa, north India, and ultimately to Spain That it did not spread all over Europe was due to the Muslim defeat by Charles Martel at Tours in 732 A D

J

Jainism. Although a wide-spread Indian sect the Jains, like the Sikhs, are regarded as heretics by the Brahmans The movement founded by Vardhamana, called Mahavira (the great hero), in the 6th cent B C arose rather earlier than Buddhism in revolt against the ritualism and impersonality of **Hinduism** (*q v*) It rejects the authority of the early Hindu Vedas and does away with many of the Hindu deities whose place is largely taken by Jainism's twenty-four immortal saints, it despises caste distinctions and modifies the two great Hindu doctrines of *karma* and transmigration Jain philosophy is based on *ahimsa*, the sacredness of all life, regarding even plants as the brethren of mankind, refusing to kill even the smallest insect The Jain temples are among the most beautiful in India

Jansenism, the name given by the Roman Catholic Church to the heresy of Cornelius Jansen (1585–1638), a Dutch-born professor of theology at Louvain, derived from his work *Augustinus*, published after his death This book set out to prove, by a study of the works of St Augustine, that Augustine's teachings on grace, predestination and free-will (which, of course, Augustine denied) were opposed to Jesuit teaching Already hostile to Jansen for forbidding them entry to Louvain university, the Jesuits were outraged and in 1653 Pope Innocent V condemned five of Jansen's propositions as heretical This produced one of the most famous controversies in history in which the scholars and divines of the great convent of Port Royal in Paris defended the *Augustinus*, for which they were later expelled from their posts Meanwhile the great Pascal (1623–62) had taken up his pen in their defence and exposed Jesuit hypocrisy in his *Lettres Provinciales*, one of the masterpieces of world literature for its brilliant phrasing, delicate irony, and deadly quotation from Jesuit writings The Letters had great influence, filled the Jesuits with rage, but even Pascal could not stop the cruel persecution which followed Another Jansenist text-book was published late in the century, Quesnel's *Moral Reflections on the New Testament*, which Pope Clement XI in his bull *Unigenitus* condemned as heretical in 1713 The French Church was split from top to bottom, the aged king Louis XIV supported the bull, and in 1720 it was made part of French law Most Jansenists fled the country Thus ended Jansenism in France but a small sect still exists in Holland, Catholic in everything except acceptance of the *Unigenitus*

Jehovah's Witnesses, a religious body who consider themselves to be the present-day representatives of a religious movement which has existed since Abel "offered unto God a more excellent sacrifice than Cain, by which he obtained witness that he was righteous" Abel was the first "witness," and amongst others were Enoch, Noah, Abraham, Moses, Jeremiah, and John the Baptist Pre-eminent among witnesses, of course, was Jesus Christ who is described in the Book of Revelation as "the faithful and true witness" Thus they see themselves as "the Lord's organisation," in the long line of those who through the ages have preserved on earth the true and pure worship of God or, as the Witnesses prefer to call Him, "Jehovah-God"

So far as other people are aware, the movement was founded by Charles Taze Russell (Pastor Russell) of Allegany, Pittsburgh, Pennsylvania, U S A in 1881 under the name, adopted in 1896, of the Watch Tower Bible and

Tract Society, which has continued as the controlling organisation of Jehovah's Witnesses. Its magazine, *The Watch Tower Announcing Jehovah's Kingdom*, first published in 1879, and other publications are distributed by the zealous members who carry out the house-to-house canvassing. The movement has a strong leadership.

Their teaching centres upon the early establishment of God's new world on earth, preceded by the second coming of Christ. Witnesses believe this has already happened, and that Armageddon "will come as soon as the Witness is completed." The millennial period will give sinners a second chance of salvation and "millions now living will never die" (the title of one of their pamphlets).

The dead will progressively be raised to the new earth until all the vacant places left after Armageddon are filled. There is, however, some doubt about the "goatish souls" who have made themselves unpleasant to the Witnesses, those who have accepted (or permitted to be accepted) a blood-transfusion contrary to the Scriptures, and others who have committed grave sins.

Every belief held by the movement, it is claimed, can be upheld, chapter and verse, by reference to the Scriptures. Witnesses regard the doctrine of the Trinity as devised by Satan. In both wars Witnesses have been in trouble for their refusal to take part in war and it is only fair to add that six thousand suffered for the same reason in German concentration camps.

Judaism, the religion of the Jews, the oldest of the great monotheist religions, parent of Christianity and Islam, the development of which is presented in the Old Testament. The creed of Judaism is based on the concept of a transcendent and omnipotent One True God, the revelation of His will in the *Torah*, and the special relation between God and His "Chosen People." The idea of Incarnation is rejected, Jesus is not recognised as the Messiah. The *Torah* is the Hebrew name for the Law of Moses (the Pentateuch) which, Judaism holds, was divinely revealed to Moses on Mount Sinai soon after the exodus of the Israelites from Egypt (1230 B.C.). Many critics deny the Mosaic authorship of the first five books of the Bible and believe them to be a compilation from four main sources known as J (Jahvist), E (Elohist), D (Deuteronomist) and P (Priestly Code), distinguished from each other by the name used for God, language, style, and internal evidence. From the historical point of view an important influence on Judaism may have been the monotheism of Ikhnaton, the "heretic" Pharaoh (note, for example, the derivation of Psalm 104 from Ikhnaton's "Hymn to the Sun").

The Talmud is a book containing the civil and canonical laws of the Jews and includes the Mishna, a compilation from oral tradition written in Hebrew, and the Gemara, a collection of comments and criticisms by the Jewish rabbis, written in Aramaic. There are in fact two Talmuds: the one made in Palestine (the Jerusalem Talmud), finished at the beginning of the 5th cent., and the other made in Babylon, completed at the end of the 6th cent.

Judaism at the beginning of the Christian era had a number of sects: (1) the Pharisees (whose views include the first clear statement of the resurrection of the just to eternal life and the future punishment of the wicked) who held to the *Torah* and the universality of God. (2) the Sadducees, the upper class of priests and wealthy landowners, to whom God was essentially a national God and who placed the interests of the state before the *Torah*, they rejected ideas of resurrection and eternal life. (3) the Essenes (*q.v.*) who were regarded as a puritanical break-away movement by both parties. The views of the Pharisees prevailed.

Jewish writing continued through the years and some books were added to the *Torah*, among them the Three Major Prophets and certain books of the Twelve Minor Prophets. There were also the Apocalyptic writers who were unorthodox in their preaching of a divinely planned catastrophic end to the world with a "new Heaven and a new earth," preceded by a divine Messiah, and a future life—all of which beliefs influenced early Christianity. Judah Halevi of Toledo (*c.* 1085–*c.* 1140) and Moses Maimonides of Cordova (1135–1204) were the great Jewish philosophers.

Modern movements in Judaism stem from the Enlightenment, notably with Moses Mendelssohn in the 18th cent. who accepted, as was the tendency of the period, only that which could be proved by reason. He translated the Pentateuch into German thus encouraging German Jews to give up Yiddish and Hebrew for the language of the land and thereby preparing them for their vast contribution to Western civilisation. One of his disciples, David Friedländer (d. 1834) instituted "reform" Judaism behind which lay the desire for assimilation. He wanted to eliminate anything that would hamper the relationships of Jews with their neighbours or tend to call in doubt their loyalty to their adopted state. A similar movement in America (1885) called for the rejection of dietary laws, the inauguration of Sunday services, and the repudiation of Jewish nationalism. Between "reform" and orthodoxy there arose the conservative movement which, in England, includes prayers in English in the service, does not segregate men and women in the synagogue, and translates the Law in a more liberal way. (The fact is that it would be almost impossible for a strictly orthodox Jew to live in a modern industrialised community at all.)

Judaism is essentially a social and family religion which, more than almost any other, concerns itself with the observances of every aspect of daily life. As in Islam (*q.v.*) details are laid down in the most minute way for the behaviour of the orthodox.

The home is the main Jewish institution and Jews, like Catholics, cannot surrender their religion. Circumcision takes place eight days after birth, and a boy becomes a man for religious purposes at his Bar Mitzvah at the age of thirteen. Women are spared most of this because their place in the home is considered sufficiently sacred. Among festivals are Passover, recalling the Exodus, Rosh Hashanah (the Jewish New Year) the anniversary of the Creation and the beginning of ten days of penitence ending with Yom Kippur (the Day of Atonement), a day of fasting spent in the synagogue, Purim, celebrating the deliverance of the Jews from Haman, and Chanukah, celebrating their victory against the Syrians under their leader Judas Maccabeus. A new and semi-religious festival with some Jews is the Yom Haatzmaut, the anniversary of the birth of the new Jewish state of Israel.

K

Karma. *See* **Buddhism, Hinduism.**

Ku Klux Klan. After the American Civil War (1861–65) southern conservatives and ex-Confederate leaders began to fear (as they had every reason to do) both Negro and poor White rule. Taxes were rising owing to radical legislation and the tax-burdened and disenfranchised planters finally took to illegal means to achieve their ends by trying to effect an alliance with the poor White and small farmer through appealing to his anti-Negro prejudice.

Hence the Ku Klux Klan was formed in 1866 as a secret society by a small group of Confederate veterans in Tennessee with the intention of frightening Negroes by dressing in ghostly white robes in the guise of the spirits of dead soldiers. But the movement spread like wild-fire throughout the South encouraged by small farmers and planters alike. General Nathan Bedford Forrest was appointed "Grand Wizard" of the Klan "empire" and in every community armed Klansmen riding at night horsewhipped "uppity" Negroes, beat Union soldiers, and threatened carpet-bag politicians (*i.e.*, fortune-hunters from the North). Soon several similar organisations arose, many of which did not stop at torture, burning property, and murder. In fact, although claiming to be a "holy crusade" the Klan was a vicious and contemptible organisation in which former Southern leaders trying to regain control deliberately set poor and middle-class Whites against the Negroes by appeal to race-prejudice. Congress struck

back with laws and intervention of Federal troops, and after a large number of convictions in South Carolina much of the violence stopped even if the feelings continued

After the 1914–18 war the movement, dormant since 1900, revived as a sadistic anti-Negro, anti-Jewish, anti-Catholic society, spreading to the north as well as the south. By 1924, it claimed four million members and held the balance of power in several northern states, but by 1926, with its white-gowned hooligans and fiery crosses, the Klan had begun to subside once more. It rose again, however, after the second world war, although on a much lesser scale than previously

L

Lamaism, the religion of Tibet, which is to Tibetans the most genuine form of Buddhist orthodoxy, but to others a corrupt and primitive tyranny and a complete perversion of everything the Buddha ever taught. Its beliefs and worship derive from the Mahayana form of Buddhism which was introduced into Tibet in 749 A.D. The belief in a saving Buddha, reappearing at intervals of five thousand years, as a man who by successive reincarnations had become perfect, developed into the notion of a spirit hovering between earth and heaven attended by hosts of demons. The emphasis laid by its founder on the necessity for self-discipline and conversion through meditation and the study of philosophy had deteriorated into formal monasticism and ritualism. In Tibet, Mahayanan Buddhism came into contact with demon-worship which, as the original religion of the country, at first suppressed and banished the new religion or subverted its members and, on its later return, contaminated it to the Lamaistic form. This process was completed by the 15th cent. The religion from its original unworldly form became a form of civil government in which the Dalai Lama, as the reincarnated Buddha, is both king and high priest, a sort of pope and emperor rolled into one, who rules despotically in both civil and religious affairs. Under him is a hierarchy of officials in which the lowest order is that of the monks who are as numerous as one man in every six or seven of the population. The main "work" carried out by this vast "church-state" is the collection of taxes which maintain the monasteries and other religious offices. When the Dalai Lama dies, his spirit is held to pass into the body of a new-born child, who is selected by a royal search party which allegedly recognises him by certain marks. Second in power to the Dalai Lama is the Panchen or Tashi Lama believed to be a reincarnation of Amitabha, another Buddha. Of course, there is no doubt that monasticism is in harmony with the spirit of Buddhism but it seems fairly clear that that practised in Tibet is a very degenerate form. Nevertheless the prestige of the Lama and the mystery surrounding the city of Lhasa in a land which till recently had been rigidly secluded from strangers has been high and spread as far as distant parts of China and even to southern India. It remains to be seen what effects Chinese communism will have upon the land and whether the miraculous happenings reported by credulous European visitors (perhaps in some cases protected by the fact that nobody was able to contradict them) will survive the impact of dialectical materialism

Latitudinarians, Anglican churchmen of exceedingly broad views (*e.g.*, bishops who would admit dissenters—*i.e.*, those rejecting the views or authority of the Established Church). Although still used today, the term applies especially to such eminent 17th cent. divines as Burnet, Hales, Tillotson, and Chillingworth

Levellers, an English military-politico-religious party prominent in the Parliamentary Army about 1647 which stood for the rights of the people. *See* **Diggers.**

Liberalism. The Liberal Party is the successor to the Whigs (a nickname derived from *whiggamore* used in the 17th cent. for Scottish dissenters) of the 18th and 19th cent. Prior to the victory of the Labour Party in 1922, it was one of the two main British political parties. Liberals are moderately progressive in the sense that most appreciate the humanistic aspects of socialism while strongly disapproving of its policies of state control, and they dislike any form of monopoly, state-run or otherwise. In general, the Party advocates co-ownership in industry to end the conflict between capital and labour, electoral reform (proportional representation), protection of individual liberties against both sides whether the ruling-class or trade unions, separate parliamentary assemblies for Scotland and Wales, international agreement on atomic energy, strict measures against any form of monopoly, and it gave full support for entry to the Common Market

Logical Positivism, a school of philosophy founded in Vienna in the 1920s by a group known as "the Vienna circle": their work was based on that of Ernst Mach, but dates in essentials as far back as Hume. Of the leaders of the group, Schlick was murdered by a student, Wittgenstein came to Britain, and Carnap went to America following the entry of the Nazis. Briefly, the philosophy differs from all others in that, while most people have believed that a statement might be (*a*) true, or (*b*) false, logical positivists consider there to be a third category, a statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, *i.e.*, those in which the statement is merely a definition of the subject, such as "a triangle is a three-sided plane figure" ("triangle" and "three-sided plane figure" are the same thing), and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy, in particular it excludes the possibility of metaphysics. Thus the question as to whether there is a God or whether free-will exists is strictly meaningless, for it is neither a tautological statement nor can it be tested by sense-experience

Lollards, a body of Reformers who, under the leadership of Wyclif, were subjected to cruel persecution in the reign of Richard II. Sir John Oldcastle was a prominent Lollard, and was burned at the stake

Lutheranism. The Reformation had a long history before it became, under Luther and Calvin, an accepted fact. The mediaeval Church had held (as the Catholic Church holds today) that the sacraments were the indispensable means of salvation. Since these were exclusively administered by the clergy, any movement which attacked clerical abuses was forced by sheer necessity to deny the Church's exclusive control of the means of salvation, before it could become free from dependence on a corrupt priesthood. Hence the Albigenses and the Waldenses (*q.v.*), the followers of John Hus and Wyclif (*see* **Anticlericalism**), were bound to deny the authority of the Church and emphasise that of the Bible. Luther began his movement primarily in order to reform the Church from its gross abuses and the famous ninety-five theses nailed to the door of the Church at Wittenberg in 1517 were not primarily theological but moral complaints dealing with the actual behaviour of the clergy rather than Church beliefs. But unlike the earlier reformers, Luther had arrived at the right moment in history when economic individualism and the force of nationalism were bound, sooner or later, to cause the authorities in Germany to line up on his side. Thus he began with the support of the peasants who were genuinely shocked at the abuse of indulgences and other matters, but ended up by being supported by the noblemen who wanted to destroy the power of the pope over the German states and looked forward to confiscating the lands and property of the Church. When the peasants wanted the reform of actual economic abuses relating to the feudal system, Luther took the side of the nobles against them. The contemporary movement in Switzerland led by Ulrich Zwingli had no such secular support, and Zwingli was killed in 1531

Martin Luther (1483–1546) was the son of a miner in Eisleben in Saxony, entered the order of Austin Friars in 1505, and later taught at the newly founded university of Wittenberg. After the publication of the theses the real issue

so far as the Church was concerned was whether he was willing or not to submit to the authority of his superiors. Luther refused to compromise with his conscience in the famous words "Here I stand; I can do no other" In a further statement Luther recommended the formation of a German national church, the abolition of indulgences and other means whereby Rome obtained money from Germany, and an end to the celibacy of the clergy. For this he was naturally excommunicated His teaching was based on the German translation of the Bible, but he was by no means a fundamentalist e g, he denied that the Book of Hebrews was written by Paul, would have nothing to do with the Apocalypse, and regarded the letter of James as "an epistle of straw" The Scriptures were open to all and could be interpreted by private judgment enlightened by the Spirit of God Like Calvin, Luther was a predestinarian and determinist, but he was also a conservative and soon became alarmed about the position taken by many extremists once the Reformation was under way He had really wanted the Church to reform itself, but when he alienated Rome he had perforce to rely more and more on the secular powers which finally resulted in the state-church form which became pronounced in Prussia and later elsewhere Whereas Calvin wished the Church to be at least the equal of the State and in some respects its superior, Luther's rebellion resulted in the reverse, a state-controlled episcopalianism The modern Lutheran Church is most active in Germany (where it has been freed from state control and is now called the Evangelical United Brethren Church), the Scandinavian countries (where it is the established state church) and in the United States *See* **Calvinism, Presbyterianism.**

M

Magic, a form of belief originating in very early days and based on the primitive's inability to distinguish between similarity and identity The simplest example would perhaps be the fertility rites in which it is believed that a ceremony involving sexual relations between men and women will bring about fertility in the harvest Or the idea that sticking pins in an image of an individual will bring about harm or even death to the real person Magic is regarded by some as a form of early science in that man in his efforts to control Nature had recourse to magical practices when the only methods he knew had failed to bring the desired results It filled a gap By others magic is regarded as an elementary stage in the evolution of religion it can be said to have served a purpose there too Yet magic differs from religion, however closely at times it may come to be related with it, in this important respect religion depends upon a power *outside and beyond* human beings, whereas magic depends upon nothing but the casting of a spell or the performance of a ceremony– the result follows automatically (We do well, as Dr Margaret Murray reminds us, to keep in mind "that when anything regarded as out of the ordinary course of nature is brought about by human means it is called a miracle if the magician belongs to the beholder's own religion, but it is magic—often black magic—if the wizard belongs to another religion In Grimm's words, 'Miracle is divine, Magic is devilish'")

The idea that "like produces like" is at the roots of imitative magic, and it is interesting to note that in some languages (*e g*, Hebrew and Arabic) there is no word for "resembles" or "similar to" Hence one says "All thy garments are myrrh" instead of "are *like* myrrh." It follows that an event can be compelled by imitating it One engages in swinging, not for pleasure, but to produce a wind as the swing does, ball games are played to get rainy weather because the black ball represents dark rainclouds, other ball games, in which one attempts to catch the ball in a cup or hit it with a stick, represent the sexual act (as some gentlemen at Lords may be distressed to hear) and bring about fertility, in medicine up till a few centuries ago herbs were chosen to cure a disease because in some respects their leaves or other parts looked like the part of the body affected (*e g*, the common wildflower still known as "eyebright" was used in bathing the eyes because the flower looks like a tiny eye)

Traces of these beliefs are still found today in children's games and the spells accompanying them have turned into nursery rhymes dolls are the images of deposed gods or idols; tug-of-war was formerly a sex-conflict with men pulling one end and women the other to bring about fertility, skittles when knocked down by a ball produced the thunder-noise necessary to produce rain There is reason to believe that the oldest words known in English, relics of our prehistoric language, are "Ena, mena, mina, mo" of the nursery rhyme

Divination is another aspect of magic and no general of the past would have gone to war without consulting his diviners who referred to animals' livers, how the sacred chickens ate, or the way ceremonially shot arrows fell Even Cicero wrote a book on divination discussing the significance of dreams, premonitions, and the flight of birds, which revealed the purposes of the gods If we find it difficult to make any distinction between diviners, priests, medicine men, rain-makers, shamans, and witch-doctors of early societies, we could perhaps say that they have crystallised out into priests, scientists, and humbugs of our own day For it would appear that magic, like witchcraft, still exists today—not merely in the form of children's stories and fears, or grown-ups' enjoyment of creepy tales, belief in fortune-telling, omens, amulets, and our own half-embarrassed fear of walking under ladders—but as cults attracting many of those who ought to have more sense *See* **Witchcraft.**

Malthusianism, the theory about population growth put forward by the Rev Thomas Malthus (1766–1834) in *An Essay on Population* (1798) His three main propositions were (1) "Population is necessarily limited by means of subsistence" (2) "Population invariably increases where means of subsistence increase unless prevented by some very powerful and obvious checks" (3) "These checks, and the checks which repress the superior power of population, and keep its effects on a level with the means of subsistence, are all resolvable into moral restraint, vice and misery" In other words, no matter how great the food supply may become, human reproductive power will always adjust itself so that food will always be scarce in relation to population, the only means to deal with this is by "moral restraint" (*i e*, chastity or not marrying), "vice" (*i e*, birth-control methods), or misery (*i e*, starvation) More specifically, Malthus claimed that while food increases by arithmetical progression, population increases by geometrical progression

It is true that these gloomy predictions did not take place in Malthus's time largely owing to the opening up of new areas of land outside Europe, the development of new techniques in agriculture, the growth of international trade to poorer areas, the increased knowledge of birth-control, and developments in medical science which reduced the misery he had predicted Furthermore, we now know that as a society becomes industrialised its birth-rate tends to fall Nevertheless there are very few scientists who are not perturbed by the growth in the world's population which has increased from about 465 million in 1650 to nearly 3,000 million today

Manichaeism The early Christian apologists who had not yet acquired an adequate knowledge of philosophy had little intellectual trouble in dealing with the heathen, their trouble arose when confronted with religions which had a philosophical basis Thus Gnosticism (*q v.*) caused them a good deal of concern, Neoplatonism (*see* God and Man) rather less, since it could never appeal to the masses, and Manichaeism considerable anxiety, because it could appeal both to the philosopher and the masses Mithraism (*q v*), the only other serious contendant, was troublesome for a different reason in that it was the religion of the Roman army and bore a close resemblance to Christianity itself.

Manichaeism was an Asiatic religion which

developed from Zoroastrianism (*q v*) and to some extent from Buddhism (*q v*), being founded by Mani, a Persian, who was born in Babylonia, c 216 A D Mani presented himself to Shapur I as the founder of a new religion which was to be to Babylonia what Buddhism was to India or Christianity to the West His aspiration was to convert the East and he himself made no attempt to interfere directly with Christianity although he represented himself as the Paraclete (the Holy Ghost or "Comforter") and, like Jesus, had twelve disciples His success in Persia aroused the fury of the Zoroastrian priests who objected to his reforming zeal towards their religion and in 276 Mani was taken prisoner and crucified

Manichaeism resembles Gnosticism in aiming to give secret knowledge rather than to save the soul, although knowledge was held to be necessary for salvation Of Mani's complicated system little can be said here, save that it is based on the struggle of two eternal conflicting principles, God and matter, or light and darkness Like the Albigenses (who followed much of this heresy) Mani divided the faithful into two classes the "Perfect" who were to practise the most rigid asceticism, and the "Hearers" whose discipline was much less severe After death the former went to heaven immediately, the latter reached it only through a kind of purgatory, and the unbelievers were doomed to hell All Manichaeans were to fast at frequent intervals and pray constantly, they had no priesthood and their only festival was the "Bema," the anniversary of Mani's crucifixion Although its founder had no intention of interfering with the West, after his death his followers soon spread the religion from Persia and Mesopotamia to India and China (Manichaeism flourished in China until the 11th cent) It reached as far as Spain and Gaul and influenced many of the bishops in Alexandria and in Carthage where for a time St Augustine accepted Manichaeism Soon the toleration accorded it under Constantine ended and it was treated as a heresy and violently suppressed Yet it later influenced many heresies, including, as we have seen, the Albigenses, and it even had some influence on orthodox Catholicism which had a genius for picking up elements in other religions which had been shown to appeal to worshippers provided they did not conflict unduly with fundamental beliefs

Maronites, a Roman Catholic community of Christians living in the Mount Lebanon region Their secular clergy marry as in the Greek Church, but their bishops are celibate

Marxism. The doctrine formulated by Karl Marx and Friedrich Engels about the middle of the 19th cent and the basis of modern communist theory (with the addition of the works of Lenin) Marxist thought was strongly influenced by that of Hegel, but the idealism of Hegel was transformed into the materialism of Marx and Engels The most important aspect of Marxism is its interpretation of history, which is seen as the history of class struggles according to the law of the dialectic described by Hegel. Thus the feudal system with its land-owning aristocracy was thesis to the antithesis of the rising merchant class, and the result (synthesis) was the modern capitalist system, which in its turn will be thesis to the working-class's antithesis leading to the classless society Differing ideologies and, in fact, differing cultures, are produced by the economic relations within a society, thus all ideologies are a form of propaganda for the ruling class (*e g* , Darwin's theory of the struggle for existence was a justification of the capitalist's attitude to the working-class) Marxism also implies an economic theory based on the concept of surplus value, and is applied to physics, biology, and all other sciences in the form of dialectical materialism (*q v*) Although the work of Marx has led to a greater understanding of society and contains much truth, few other than communists accept the theory wholeheartedly Anthropologists accept that the material and technological structure of a society influences the ideologies and the way of life of the individuals within it, but they would not agree that it completely determines them. *See also* **Dialectical Materialism, Communism.**

Matriarchy, a theory in anthropology developed by Bachofen (*Das Mutterrecht*, 1861) and followed by the American Briffault (*The Mothers*, 1927) that society was originally a matriarchate with authority invested in women The opinion of nearly all modern anthropologists, however, is against this view. Both historically and today a genuine matriarchate is nowhere to be found, although in a few places feminine prerogatives have evolved to a marked degree in various directions. Thus there are societies which are *matrilineal* (*i e* , where descent is traced through the mother's side) and it is quite possible that this used to be the general state of affairs since, at a time when man's part in reproduction was unclear, one could only be certain of the individual's mother There are other societies in which residence is *matrilocal* (*i e* , where the married couple live in the home of the wife's family) But neither of these has any bearing on the issue of whether women ever *ruled* society Furthermore, there are groups where women are physically stronger than men, where agriculture is primarily in their hands, where, as in the case of the famous bodyguard of the King of Dahomey, they are even soldiers, where men, rather than women, do the cooking or sewing Yet the question of societies ruled by women either in the past or present may be ruled out, the subject is closed

Mennonites. *See* **Baptists.**

Mensheviks. *See* **Bolshevism.**

Methodism, the religious movement founded by John Wesley in 1738, at a time when the Anglican Church was in one of its periodic phases of spiritual torpor, with the simple aim of spreading "scriptural holiness" throughout the land. Up to that time Wesley had been a High Churchman but on a visit to Georgia in the United States he was much impressed by the group known as Moravians (*q v*), and on his return to this country was introduced by his brother Charles, who had already become an adherent, to Peter Bohler, a Moravian minister in England Passing through a period of spiritual commotion following the meeting, he first saw the light at a small service in Aldersgate in May 1738 "where one was reading Luther's preface to the Epistle to the Romans" and from this time forth all Wesley's energies were devoted to the single object of saving souls He did this for fifty years and at the end of his life confessed that he had wasted fifteen minutes in that time by reading a worthless book Even when he was over eighty he still rose at 4 a m a d toiled all day long

Soon Whitefield, a follower with Calvinist views, was preaching throughout the country and Charles Wesley was composing his well-known hymns. John's abilities at this time were taken up in organising the movement described as "People called Methodists" They were to be arranged in "societies" which were united into "circuits" under a minister, the circuits into "districts" and all knit together into a single body under a conference of ministers which has met annually since 1744 Local lay preachers were also employed and to maintain interest the ministers were moved from circuit to circuit each year These chapel services were not originally meant to conflict with the Church of England of which Wesley still considered himself a member They were purely supplementary, and it used to be the custom (before the Methodists began to count themselves as Nonconformists) for Methodists to attend Church in the morning and Chapel in the evening

The class-meeting was the unit of the organisation where members met regularly under a chosen leader to tell their "experiences" upon which they were often subjected to severe cross-examination At the end of every quarter, provided their attendances were regular, they received a ticket of membership which entitled them to come to monthly sacramental services If attendance was inadequate the name was removed from the list, without appearance on which nobody was deemed a member. The price of the ticket was "a penny a week and a shilling a quarter" but Wesley was not interested in receiving money from anyone who was not utterly devoted to the cause

John Wesley introduced four other innova-

tions, some of which were regarded by Churchmen who had previously been willing to commend his efforts in bringing religion to the poorer classes as dangerous: (1) He started the Sunday-school scheme and afterwards enthusiastically supported that of John Raikes, often regarded as the founder of the idea, this was of immense importance in the days before the Education Acts (2) He reintroduced the Agapae or "love feasts" of the early Church which were fellowship meetings deepening the sense of brotherhood of the society. (3) He began to copy the open-air meetings of the eloquent Whitefield and soon unwittingly produced the most extraordinary results, finding that his sermons led to groans, tears, faintingfits, and all sorts of emotional expression Even his open-air lay speakers produced like results and these came to be associated with Methodism and gave significance to the proud Anglican claim that *their* services would be "without enthusiasm" (4) After some hesitation he ventured to consecrate Dr Thomas Coke, who was being sent as a missionary to America, as a bishop of his church In addition to Wesley's religious work he was a great educator of the common man Thus he introduced the cheap book and the church magazine, publishing books of any sort which he thought would edify and not harm even when the views expressed were different from his own—*e g*, Thomas à Kempis's *Imitation of Christ* and works of history biography, science, and medicine in some cases written by himself In this way the movement with its cheap books and reading rooms had an influence far beyond its actual membership Both the Anglican Church and the Evangelical movement of Wilberforce and others profited from Wesley's work Some social historians, rightly or wrongly, have claimed that it was Wesley's influence among the working classes that spared England the revolutionary activity which characterised most other European countries during the first quarter of the 19th cent

Methodism, especially after Wesley's death in 1791, began, like other movements, to develop schisms There were the long standing differences which the Baptist movement (*q v*) had shown too between Arminian and Calvinist sections—*i e*, between those who did and those who did not accept the doctrine of predestination In the case of the Methodists, this led to a complete break in 1811 Then there were differences associated with the status of the laity, or the relationship of the movement with the Anglican Church The "Methodist New Connection" of 1797 differed only in giving the laity equal representation with the ministers but the more important break of the Primitive Methodists in 1810 gave still more power to the laity and reintroduced the "camp-meeting" type of service In 1815 the Bryanites or "Bible Christians" were formed, and a further schism which was even brought before the law courts was ostensibly over the foundation of a theological college The real reason, of course, was that the ministers were becoming more Tory, whilst the laity were becoming more Radical Finally in 1932, at a conference in the Albert Hall in London, the Wesleyan Methodists, the Primitive Methodists, and the United Methodists became one Church, the Methodist Church. Including America, where Methodism under the original direction of Thomas Coke spread like wildfire, the Methodist is one of the largest Protestant Churches of today

Mind and Matter.

Early Greek Views: Idealism and Dualism Primitive peoples could see that there is a distinction between those things which move and do things by themselves and others, such as stones, which do not Following the early state of **Animism** (*q v*), in which spirits were believed to have their abode in everything, they began to differentiate between matter or substance and a force which seems to move it and shape it into objects and things Thus to the Greek Parmenides (fl *c* 475 B C), who was a philosopher of pure reason, thought or mind was the creator of what we observe and in some way not quite clear to himself it seemed that mind was the cause of everything This is perhaps the first expression of the movement known as Idealism which says, in effect, that the whole universe is mental—a creation either of our own minds or the mind of God But from Anaxagoras (488–428 B C) we have the clearer statement that mind or *nous* causes all movement but is distinct from the substance it moves He does not, however, think in terms of individual minds but rather of a kind of generalised mind throughout the universe which can be used as an explanation of anything which cannot be explained otherwise This is the position known as **Dualism** (*q v*) which holds that both mind and matter exist and interact but are separate entities

Most people in practice are dualists since, rightly or wrongly, mind and body are thought of as two different things, it is the "commonsense" (although not necessarily the true) point of view Plato in a much more complex way was also a dualist although he held that the world of matter we observe is in some sense not the genuine world. The real world is the world of ideas and the tree we see is not real but simply matter upon which mind or soul has imprinted the idea of a tree Everything that exists has its corresponding form in the world of ideas and imprints its pattern upon matter Mind has always existed and, having become entangled with matter, is constantly seeking to free itself and return to God

Plato's pupil Aristotle had a much more scientific outlook and held that, although it was mind which gave matter its form, mind is not *outside* matter, as Plato had thought, but *inside* it as its formative principle Therefore there could be no mind without matter and no matter without mind, for even the lowest forms of matter have some degree of mind which increases in quantity and quality as we move up the scale to more complex things

So far, nobody had explained how two such different substances as matter and mind could influence each other in any way, and this remains, in spite of attempts to be mentioned later, a basic problem in philosophy

Two later ideas, one of them rather foolish and the other simply refusing to answer the question, are typified by the Stoics and some members of the Sceptic school The first is that only matter exists and what we call mind is merely matter of a finer texture, a view which as an explanation is unlikely to satisfy anyone, the other, that of some Sceptics, is that we can know nothing except the fleeting images or thoughts that flicker through our consciousness Of either mind or matter we know nothing

Renaissance Attitude Christian doctrines have already been dealt with (*see* **God and Man, Determinism and Free-will**), and the past and future of the soul is dealt with under **Immortality**. Nor need we mention the Renaissance philosophers who were really much more concerned about how to use mind than about its nature When they did consider the subject they usually dealt with it, as did Francis Bacon, by separating the sphere of science from that of religion and giving the orthodox view of the latter because there were still good reasons for not wishing to annoy the Church

17th-cent Views Hobbes, Descartes, Guelincx, Spinoza, Locke, Berkeley Thomas Hobbes in the 17th cent was really one of the first to attempt a modern explanation of mind and matter even if his attempt was crude As a materialist he held that all that exists is matter and hence our thoughts, ideas, images, and actions are really a form of motion taking place within the brain and nerves. This is the materialist theory which states that mind does not exist

Thus there are three basic theories of the nature of mind and body idealism, dualism, and materialism, and we may accept any one of the three But, if we accept dualism, we shall have to explain precisely the relationship between body and mind. In some of his later writings Hobbes seems to suggest that mental processes are the effects of motion rather than motion itself, *i e*, they exist, but only as a result of physical processes just as a flame does on a candle This theory of the relationship is known as *epiphenomenalism*

Descartes, the great French contemporary of

Hobbes, was a dualist who believed that mind and matter both exist and are entirely different entities, therefore he had to ask himself how, for example, the desire to walk leads to the physical motion of walking. His unsatisfactory answer was that, although animals are pure automatons, man is different in that he has a soul which resides in the pineal gland (a tiny structure in the brain which today we know to be a relic of evolution with no present function whatever). In this gland the mind comes in contact with the "vital spirits" of the body and thus there is interaction between the two. This theory is known as *interactionism*, and since we do not accept its basis in the function of the pineal gland, we are simply left with the notion of interaction but without the explanation of how it takes place.

One of Descartes's successors, Arnold Guelincx, produced the even more improbable theory of *psychophysical parallelism*, sometimes known as the theory of the "two clocks". Imagine you have two clocks, each keeping perfect time, then supposing you saw one and heard the other, every time one points to the hour the other will strike, giving the impression that the first event causes the second, although in fact they are quite unrelated. So it is with the body and mind in Guelincx's view, each is "wound up" by God in the beginning in such a way as to keep time with the other so that when I have the desire to walk purely unrelated physical events in my legs cause them to move at the same time. A variety of this theory is *occasionalism*, which says that whenever something happens in the physical world, God affects us so that we *think* we are being affected by the happening.

The trouble about all these theories is (*a*) that they really explain nothing, and (*b*) that they give us a very peculiar view of God as a celestial showman treating us as puppets when it would surely have been easier to create a world in which mind and matter simply interacted by their very nature. Spinoza, too, believed in a sort of psychophysical parallelism in that he did not think that mind and body interacted. But since in his theory everything is God, mind and matter are simply two sides of the same penny.

John Locke, another contemporary, thought of the mind as a blank slate upon which the world writes in the form of sensations, for we have no innate or inborn ideas and mind and matter do interact although he does not tell us how. All we know are sensations—*i.e.*, sense impressions. Bishop Berkeley carried this idea to its logical conclusion: if we know nothing but sensations, we have no reason to suppose that matter exists at all. He was, therefore, an idealist.

18th cent. Views: Hume, Kant. David Hume went further still and pointed out that, if all we know are sensations, we cannot prove the existence of matter but we cannot prove the existence of mind either. All we can ever know is that ideas, impressions, thoughts, follow each other. We do not even experience a self or personality because every time we look into our "minds" all we really experience are thoughts and impressions. Hume was quick to point out that this was not the same as saying that the self did not exist, it only proved that we cannot know that it does.

Kant made it clear that, although there is a world outside ourselves, we can never know what it is really like. The mind receives impressions and forms them into patterns which conform not to the thing-in-itself but to the nature of mind. Space and time, for example, are not realities but only the form into which our mind fits its sensations. In other words our mind shapes impressions which are no more like the thing-in-itself than the map of a battlefield with pins showing the position of various army groups at any given moment is like the battlefield. This, of course, is true. From physics and physiology we know that the sounds we hear are "really" waves in the air, the sights we see "really" electromagnetic waves. What guarantee do we have that the source is "really" like the impression received in our brain? Kant was the leader of the great German Idealist movement of the 18th cent. which in effect said: "why bother about matter when all we can ever know is mental?"

19th and 20th cent. Views. The Englishman Bradley, and the Frenchman Henri Bergson in the 19th and early 20th cent. both held in one form or another the belief that mind in some way creates matter and were, therefore, idealists, whereas Comte, the positivist (*q.v.*), and the Americans William James and John Dewey, held that mind is a form of behaviour. Certain acts (*e.g.*, reflexes) are "mindless" because they are deliberate, others which are intended may be described for the sake of convenience as "minded" (*i.e.*, purposeful). But like the majority of modern psychologists—insofar as they take any interest in the subject—they regarded mind as a process going on in the living body. Is there any reason, many now ask, why we should think of mind as being any different in nature from digestion? Both are processes going on, the one in the brain, the other in the stomach and intestines. Why should we regard them as "things"? *See* **F40 (2)**.

Mithraism, a sun-religion which originated in Persia with the worship of the mythical Mithra, the god of light and of truth. It was for two centuries one of early Christianity's most formidable rivals, particularly in the West since the more philosophical Hellenic Christianity of the East had little to fear from it. (Arnold Toynbee has described Mithraism as "a pre-Zoroastrian Iranian paganism—in a Hellenic dress", Manichaeism as "Zoroastrianism—in a Christian dress".) Mithraism was a mystery-faith with secret rites known only to devotees. It appealed to the soldiers of the Roman Army which explains its spread to the farthest limits of the Roman empire and its decline as the Romans retreated. The religion resembled Zoroastrianism (*q.v.*) in that it laid stress on the constant struggle between good and evil and there are a number of parallels with Christianity, *e.g.*, a miraculous birth, death, and a glorious resurrection, a belief in heaven and hell and the immortality of the soul, a last judgment. Both religions held Sunday as the holy day of the week, celebrated 25 December (date of the pagan winter solstice festival) as the birthday of the founder, both celebrated Easter, and in their ceremonies made use of bell, holy water, and the candle. Mithraism reached its height about 275 A.D. and afterwards declined both for the reason given above and, perhaps, because it excluded women, was emotional rather than philosophical, and had no general organisation to direct its course. Yet even today, from the Euphrates to the Tyne, traces of the religion remain and antiquarians are familiar with the image of the sun-god and the inscription *Deo Soli Mithrae, Invicto, Seculari* (dedicated to the sun-god of Mithra, the unconquered).

Mohammedanism. See Islam.

Monasticism. When in the 4th cent. A.D. Constantine in effect united state and church there were naturally many who hastened to become Christians for the worldly benefits they expected it to bring in view of the new situation. But there were others who, in their efforts to escape from worldly involvement, went into the deserts of North Africa and Syria to live as hermits and so in these regions there grew up large communities of monks whose lives of renunciation made a considerable impression on the Christian world. They were men of all types but the two main groups were those who preferred to live alone and those who preferred a community life. Among the first must be included St. Anthony, the earliest of the hermits, who was born in Egypt *c.* 250 and who lived alone in a hut near his home for fifteen years, and then in the desert for a further twenty. As his fame spread Anthony came forth to teach and advocate a life of extreme austerity until by the end of his life the Thebaid (the desert around Thebes) was full of hermits following his example. (Not unnaturally, he was constantly assailed by lustful visions which he thoughtfully attributed to Satan.) In the Syrian desert St. Simeon Stylites and others were stimulated to even greater austerities and Simeon himself spent many years on the top of a pillar in a space so small that it was only possible to sit or stand

With some of these men it is obvious that ascetic discipline had become perverted into an unpleasant form of exhibitionism

The first monastery was founded by Pachomius of Egypt c 315 and here the monks had a common life with communal meals worship, and work mainly of an agricultural type In the Eastern part of the Empire St Basil (c 360) tried to check the growth of the extreme and spectacular practices of the hermits by organising monasteries in which the ascetic disciplines of fasting, meditation, and prayer, would be balanced by useful and healthy activities His monasteries had orphanages and schools for boys—not only those who were intended for a monkish life But the Eastern Church in general continued to favour the hermit life and ascetic extremes. Originally a spontaneous movement, the monastic life was introduced to the West by St Athanasius in 339 who obtained its recognition from the Church of Rome and St Augustine introduced it into North Africa beyond Egypt The movement was promoted also by St Jerome, St Martin of Tours, who introduced it into France, and St Patrick into Ireland The monastery of Iona was founded by St. Columba in 566 But it must be remembered that the Celtic Church had a life of its own which owed more to the Egyptian tradition than to Rome Unlike the more elaborate monasteries of the continent those of the early Celtic Church were often little more than a cluster of stone bee-hive huts, an oratory, and a stone cross It had its own religious ceremonies and its own art (notably its beautifully carved crosses and the illuminated manuscripts such as the Lindisfarne Gospel (c 700) and the Irish Book of Kells dating from about the same time) The Scottish St Ninian played a major part in introducing Egyptian texts and art to Britain where, mixed with Byzantine influences and the art of the Vikings, it produced a typical culture of its own Strangely enough, it was the relatively primitive Celts who played almost as large a part in preserving civilisation in Europe during the Dark Ages as did the Italians since It was St Columbanus (c 540–615) who founded the great monasteries of Annegray, Luxeuil, and Fontaine in the Vosges country, St Gall in Switzerland, and Bobbio in the Apennines So, too, it was the Anglo-Saxon Alcuin (c 735–804) who was called from York by Charlemagne to set up a system of education throughout his empire, the most famous of the monastic schools he founded was at Tours Among those influenced by him was the philosopher John Scotus Erigena

Meanwhile from the south, as the disintegrating Roman empire became increasingly corrupt, St Benedict of Nursia (c 480–c. 543) fled the pleasures of Rome to lead a hermit's life near Subiaco Here he founded some small monasteries, but c 520 made a new settlement, the great monastery of Monte Cassino in southern Italy, where he established a "Rule" for the government of monks This included both study and work and emphasised that education was necessary for the continuance of Christianity. As his influence spread his Rule was adopted by other monasteries, and schools became part of monastic life It is not possible to describe the many different orders of monks and nuns formed since, nor the mendicant orders of friars (e g, Franciscans, Dominicans, Carmelites, Augustinians). In many ways even those outside the Roman Catholic Church owe much to the monastic movement Monasticism, of course, is not peculiar to Christianity and forms a major aspect of Buddhism, especially in the form of Lamaism in Tibet (*q v.*)

Monogamy, durable mating or marriage between two individuals, one husband, one wife.

Monophysitism, a heresy of the 5th cent which grew out of a reaction against Nestorianism (*q v*). The majority of Egyptian Christians were Monophysites (Mono-physite = one nature)—*i e*, they declared Christ's human and divine nature to be one and the same This view was condemned at the Council of Chalcedon (A.D. 451) which pronounced that Jesus Christ, true God and true man, has two natures, at once perfectly distinct and inseparably joined in one person and partaking of the one divine substance However, many continued to hold Monophysite opinions, including the Coptic Church (*q v.*), declaring the Council to be unoecumenical (*i e*, not holding the views of the true and universal Christian Church).

Monopsychism, the theory of the intellect held by the Arab philosopher Averroës (1126–98) in his interpretation of Aristotle, maintaining that the individual intelligence has no existence in its own right but is part of the divine mind (*nous*) from which it emerges at birth and into which it is absorbed at death He thus denied personal immortality, a view which was opposed by Christian philosophers

Monotheism. *See* **God and Man.**

Monothelites, a Christian sect of the 7th cent which attempted to reconcile Monophysitism with orthodoxy They admitted the orthodox view of Christ's two natures as God and man, but declared that He operated with one will Monothelitism was condemned as heretical by the Council of Constantinople in 680 A D

Montanism, a Phrygian form of primitive Puritanism with many peculiar tenets into which the early Christian theologian Tertullian (c 150–c 230) was driven by his extremist views that the Christian should keep himself aloof from the world and hold no social intercourse whatever with pagans The sect had immediate expectation of Christ's second coming and indulged in prophetic utterance which they held to be inspired by the Holy Ghost but which their enemies put down to prompting by the Devil In seeking persecution and martyrdom they antagonised the Church and were suppressed

Moral Re-armament, a movement launched in 1938, a successor to the Oxford Group Movement, founded by a former American Protestant minister, Frank N D Buchman (1878–1961) On a visit to England in 1920 Buchman preached "world-changing through life-changing" to undergraduates at Oxford, hence the name Oxford Group

Two of the Group's most typical practices were group confession of sins openly and the "quiet time" set aside during the day to receive messages from the Almighty as to behaviour and current problems In the eyes of non-Groupers the confession (often of rather trivial sins) appeared to be exhibitionistic and there was felt to be a certain snobbery about the movement which made it strongly conscious of the social status of its converts However, there can be no doubt that many people were "changed" by the Oxford Group Movement

The Moral Re-armament Movement is rather different Its recent (1960) pamphlet claims that, as the friend and adviser of statesmen (of whom an imposing list is given), Frank Buchman and his new movement aided in solving many crises—political, industrial, and racial It is notable, however, that comparatively little is said of Jesus Christ whose Name was constantly on the lips of the Oxford Groupers, whereas much is made of M R A as an alternative to world communism Theologians complained of the Groups that their movement lacked doctrine and intellectual content, M R A appears to have no theological content at all

Moravian Church, a revival of the Church of the "Bohemian Brethren" which originated (1457) among some of the followers of John Hus. It developed a kind of Quakerism that rejected the use of force, refused to take oaths, and had no hierarchy It appears to have been sympathetic towards Calvinism but made unsuccessful approaches to Luther As a Protestant sect it was ruthlessly persecuted by Ferdinand II and barely managed to survive However, in the 18th cent, the body was re-established by Count Zinzendorf who offered it a place of safety in Saxony where a town called Herrnhut (God's protection) was built and this became the centre from which Moravian doctrine was spread by missionaries all over the world. Their chief belief (which had a fundamental influence on John Wesley—*see* **Methodism**) was that faith is a direct illumination from God which assures us beyond all possibility of doubt that we are saved, and that no goodness of behaviour, piety, or orthodoxy is of any use without this "sufficient, sovereign, saving grace."

Mormons, or Latter-Day Saints, one of the very numerous American religious sects, founded by Joseph Smith of the state of New York, who, at the age of eighteen, had been influenced by a local religious revival in 1823. He said that whilst praying for guidance he had been confronted by two heavenly messengers who forbade him to join any existing church but prepare to become the prophet of a new one. Soon, in a series of visions, he was told of a revelation written on golden plates concealed in a nearby hillside which he was able with the help of "Urim and Thummim" to translate into English. Described as the *Book of Mormon* this was published in 1830 and at the same time a little church of only six members was founded in Fayette, N.Y. In addition the first of Joseph Smith's "miracles"—the casting out of a devil—was performed. Smith was quite certainly an impostor who had been in trouble with the police and his *Book of Mormon* a piece of unmitigated nonsense probably written by a Presbyterian minister who had concocted the notion that the Red Indians were the lost Ten Tribes of Israel whose fate has attracted the attention of numbers of other unbalanced or ignorant people (cf. British Israelites). Yet Smith's eloquence was able to influence quite educated people including Samuel Rigdon with whose assistance it seems likely that Smith added further chapters to the book referring to Christ's alleged appearance in America after the ascension and His formation of the church. *Doctrine and Covenants* is the title of another book dealing with the revelations Smith claimed to have received. Soon the sect was in trouble with the community both because its members insisted on describing themselves as the Chosen People and others as Gentiles and because they took part in politics, voting as Smith ordered them to; therefore they were turned out from one city after another until they found themselves a dwelling-place at Nauvoo, Illinois, on the Mississippi.

That would probably have been the end of the story had not Smith been murdered in 1844 and thereby made to appear a martyr and had there not appeared Brigham Young, a quite extraordinary leader who stamped out warring factions and drove out the recalcitrant. Whilst persecutions continued Brigham Young announced that it had been revealed that he must lead the faithful to Salt Lake, then outside the area of the United States. There followed the famous trek of more than a thousand miles across desert country in which he led the way, reaching his destination on 24 July 1847 with four thousand followers who built Salt Lake City. The church was strictly ruled by its leader who also looked after affairs of state for thirty years until his death in 1877.

Polygamy, although forbidden by Smith and only sanctioned by Brigham Young when Salt Lake City had been built, is the best-known of Mormon doctrines. It is now rarely practised, although some of the old polygamous families are still alive. But polygamy is one of the least peculiar of Mormon beliefs: baptism is by immersion after the age of eight and they celebrate the Lord's Supper with water instead of wine. God is said to be of human form and Christ, although His Son, of a different substance from the Father, the Holy Spirit is not a person but an influence. Human souls are believed to have existed before birth and are anxiously waiting for human bodies to enter because only thus can they attain final bliss. (This was the justification of polygamy in supplying as many available bodies as possible.) They are millenarians, believing that some time Christ will appear and rule for a thousand years, and that since the dead are not really dead they may repent and become members of the church by "baptism for the dead." There are strange ritual performances known as "endowments" which take the form of a kind of morality play with such actors as God and Satan, Adam and Eve, and there are countless ablutions, handclaspings, and anointings. "Miracles" are still performed, for the church has recovered all the powers possessed by the early church. The Old Testament was intended for the Jewish Dispensation, the New for the Christian, but the Books of Mormon and the "Doctrine" are for the true church—although all the books are equally inspired. There are two orders of priests or leaders: the Melchizedeks, or higher order, include the apostle, the patriarch, the high priest, and the elder; the Aarons, or lower order, are deacons who attend to the temporal affairs of the church as the Melchizedeks attend to the more spiritual. This body has spread from the United States and has already set up communities in south-east England. Like the Christian Scientists it seems to possess considerable wealth.

Muggletonians, one of the many sects which arose during the Commonwealth but, unlike most of the others (**Levellers** (*q.v.*), **Diggers** (*q.v.*), **Fifth-Monarchy Men**, and the **Millenarians**) which tended to have a strongly political aspect, this was purely religious. Founded by two journeymen tailors, Lodowick Muggleton and John Reeve, who interpreted the Book of Revelation in their own peculiar way, it was decided that Reeve represented Moses, and Muggleton, Aaron. They also believed that the Father, not the Son, had died on the cross (an ancient heresy) but added the strange statement that He left Elijah in control during His period on earth. Rejecting the doctrine of the Trinity, they also asserted that God has a human body. Nevertheless, for a time, they had a large number of followers.

Mysticism, a religious attitude which concerns itself with direct relationship with God, "reality" as contrasted with appearance, or the "ultimate" in one form or another. All the higher religions have had their mystics who have not always been regarded without suspicion by their more orthodox members, and, as Bertrand Russell points out, there has been a remarkable unity of opinion among mystics which almost transcends their religious differences. Thus, characteristic of the mystical experience in general, have been the following features: (1) a belief in insight as opposed to analytical knowledge which is accompanied in the actual experience by the sense of a mystery unveiled, a hidden wisdom become certain beyond the possibility of doubt; this is often preceded by a period of utter hopelessness and isolation described as "the dark night of the soul"; (2) a belief in unity and a refusal to admit opposition or division anywhere; this sometimes appears in the form of what seem to be contradictory statements: "the way up and the way down is one and the same" (Heraclitus). There is no distinction between subject and object, the act of perception and the thing perceived; (3) a denial of the reality of time, since if all is one the distinction of past and future must be illusory; (4) a denial of the reality of evil (which does not maintain, *e.g.*, that cruelty is good but that it does not exist in the world of reality as opposed to the world of phantoms from which we are liberated by the insight of the vision). Among the great mystics have been Meister Eckhart and Jakob Boehme, the German religious mystics of the 13th and 16th cent. respectively, Acharya Sankara of India, and St. Theresa and St. John of the Cross of Spain. Mystical movements within the great religions have been: the Zen (*q.v.*) movement within Buddhism, Taoism in China, the Cabalists and Hasidim in Judaism, the Sufis within Islam, some of the Quakers within Christianity.

Mystery Religions. *See* **Orphism**.

N

Nancy School of Psychotherapy. Before Freud, the only satisfactory means of treating neurosis psychologically was hypnosis (used for centuries in one form or another, but rediscovered by Anton Mesmer (1733–1815), hence the name). Also at that time the commonest neurosis was hysteria—a condition in which physical disease is mimicked unconsciously by the production of such symptoms as paralysis, loss of memory, areas of pain, or loss of feeling, even deafness and blindness. This condition was discovered by Ambrose Liébeault of Nancy in Lorraine to be particularly susceptible to treatment by hypnosis (which, unlike Mesmer who was somewhat

of a charlatan, he used in a scientific way) Liébeault (1823–1904) and his colleague Hippolyte Bernheim (1840–1919) believed (a) that hysteria was produced by suggestion and particularly by autosuggestion on the part of the patient, and (b) that suggestion was a normal trait found in varying degrees in everyone. These conclusions are true, but as Freud showed later, are far from being the whole truth. *See* **Paris School of Psychotherapy.**

Natural Law, the specifically Roman Catholic doctrine that there is a natural moral law, irrespective of time and place, which man can know through his own reason. Originally a product of early rational philosophy, the Christian form of the doctrine is basically due to St Thomas Aquinas who defined natural law in relation to eternal law, holding that the eternal law is God's reason which governs the relations of all things in the universe to each other. The natural law is that part of the eternal law which relates to man's behaviour. Catholic natural law assumes that the human reason is capable of deriving ultimate rules for right behaviour since there are in man and his institutions certain stable structures produced by God's reason which man's reason can know to be correct and true. Thus, the basis of marriage, property, the state, and the contents of justice are held to be available to man's natural reason. The rules of positive morality and civil law are held to be valid only insofar as they conform to the natural law, which man is not only capable of knowing but also of obeying.

Protestant theologians criticise this notion. Thus Karl Barth and many others hold that sinful and fallen man cannot have any direct knowledge of God or His reason or will without the aid of revelation. Another theologian Niebuhr points out that the principles of the doctrines are too inflexible and that although they are the product of a particular time and circumstance, they are regarded as if they were absolute and eternal. In fact, as most social scientists would also agree, there is no law which can be regarded as "natural" for all men at all times. Nor does it seem sensible to suppose that all or even many men possess either the reason to discern natural law or the ability to obey it, whether or not we accept man's free-will (and all Protestant sects do not), we know as a fact of science that people are not always fully responsible for their actions and some not at all.

Nazism, the term commonly used for the political and social ideology of the German National Socialist Party led by the late Adolf Hitler. The term *Nazi* was an abbreviation of National Socialist. Those in the Federal Republic today sympathetic to National Socialist aims are known as neo-Nazis. *See* **Fascism.**

Neoplatonism. *See* **Determinism and Free-will** and **God and Man.**

Nestorian heresy. The 5th cent. of the Christian Church saw a battle of personalities and opinions waged with fanatical fury between St Cyril the patriarch of Alexandria, and Nestorius, patriarch of Constantinople. Nestorius maintained that Mary should not be called the mother of God as she was only the mother of the human and not of the divine nature of Jesus. This view was contradicted by Cyril (one of the most unpleasant saints who ever lived) who held the orthodox view. In addition to his utter destruction of Nestorius by stealthy and unremitting animosity Cyril was also responsible for the lynching of Hypatia, a distinguished mathematician and saintly woman, head of the Neoplatonist school at Alexandria. She was dragged from her chariot, stripped naked, butchered and torn to pieces in the church, and her remains burned. As if this were not enough Cyril took pains to stir up pogroms against the very large Jewish colony of Alexandria. At the Council of Ephesus (A.D. 431) the Western bishops quickly decided for Cyril. This Council (reinforced by the Council of Chalcedon in 451) clarified orthodox Catholic doctrine (*see* **Monophysitism**). Nestorius became a heretic, was banished to Antioch where he had a short respite of peace, but later, and in spite of his weakness and age, was dragged about from one place to another on the borders of Egypt. We are assured that his tongue was eaten by worms in punishment for the wicked words he had spoken, but later the Nestorian church flourished in Syria and Persia under the protection of the rulers of Persia and missions were sent to India and China.

Nihilism, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of Tsar Alexander II (1818–81), the liberator of the serfs, who, during his attempts to bring about a constitutional monarchy, was killed by a bomb. The term "nihilist," however, was first used in 1862 by Turgenev in his novel *Fathers and Children*. *See* **Anarchism.**

Nominalism. Early mediaeval thinkers were divided into two schools, those who regarded "universals" or abstract concepts as mere names without any corresponding realities (**Nominalists**), and those who held the opposite doctrine (**Realism**) that general concepts have an existence independent of individual things. The relation between universals and particulars was a subject of philosophical dispute all through the Middle Ages.

The first person to hold the nominalist doctrine was probably Roscelin or Roscellinus in the late 11th cent., but very little is known of him and none of his works remains except for a single letter to Peter Abelard who was his pupil. Roscelin was born in France, accused twice of heresy but recanted and fled to England where he attacked the views of Anselm, according to whom Roscelin used the phrase that universals were a *flatus voci* or breath of the voice. The most important nominalist was the Englishman William of Occam in the 13th cent. who, once and for all, separated the two schools by saying in effect that science is about things (the nominalist view), whereas logic, philosophy, and religion are about terms or concepts (the Platonic tradition). Both are justified, but we must distinguish between them. The proposition "man is a species" is not a proposition of logic or philosophy but a scientific statement since we cannot say whether it is true or false without knowing about man. If we fail to realise that words are conventional signs and that it is important to decide whether or not they have a meaning and refer to something, then we shall fall into logical fallacies of the type: "Man is a species, Socrates is a man, therefore Socrates is a species." This, in effect, is the beginning of the modern philosophy of logical analysis which, to oversimplify, tells us that a statement is not just true or untrue, it may also be meaningless. Therefore, in all the philosophical problems we have discussed elsewhere, there is the third possibility that the problem we are discussing has no meaning because the words refer to nothing and we must ask ourselves before going any further "what do we mean by God," has the word "free-will" any definite meaning?

Nonconformism, the attitude of all those Christian bodies which do not conform to the doctrines of the Church of England. Up to the passing of the Act of Uniformity in 1662 they were called "puritans" or "dissenters" and were often persecuted. The oldest bodies of nonconformists are the Baptists, Independents, and (in England) the Presbyterians, the Methodists, although dating from 1738, did not consider themselves nonconformists until some time later. The Presbyterians are, of course, the official Church of Scotland where it is the Anglicans (known as "Episcopalians") who are the nonconformists, although not generally described as such.

O

Occam's Razor, the philosophical maxim by which William of Occam, the 13th cent. nominalist (*q.v.*), has become best-known. This states in the form which is most familiar: "Entities are not to be multiplied without necessity" and as such does not appear in his works. He did, however, say something much to the same effect: "It is vain to do with more what can be done with fewer." In other words, if everything in some science can be interpreted without

assuming this or that hypothetical entity, there is no ground for assuming it. This is Bertrand Russell's version, and he adds "I have myself found this a most fruitful principle in logical analysis."

Occultism. *See* **Magic, Alchemy, Astrology, and Theosophy.**

Orangemen, members of an Irish society formed in Ulster in 1795 to uphold Protestantism. Their name is taken from King William III, Prince of Orange, who defeated James II at the Battle of the Boyne (1690), hence the enormous banners depicting "King Billy on the Boyne" and such other subjects or mottoes as appeal to the primitive mind when they are carried in procession on 12 July each year. The society has branches in many English-speaking countries but flourishes chiefly in Ulster.

Origenists, a sect of early religionists led by the Christian Father Origen in the 3rd cent., who accepted in general the doctrines of Plotinus (*see* **Neoplatonism**). They believed that men's souls are created before their bodies and are striving to enter bodies as they are born. When the soul leaves the body it enters another body if it has been sinful since justice requires punishment, but the punishment happens naturally through the driving power of the sinner's own errors. The celestial bodies are believed also to have souls, and it is asserted that Christ was the Son of God only by adoption and grace. The Council of Constantinople in 553 condemned Origen's doctrines.

Orphism. The Greeks in general thought very little of their gods, regarding them as similar to human beings with human failings and virtues although on a larger scale. But there was another aspect of Greek religion which was passionate, ecstatic, and secret, dealing with the worship of various figures among whom were Bacchus or Dionysus, Orpheus, and Demeter and Persephone of the Eleusinian Mysteries. Dionysus (or Bacchus) was originally a god from Thrace where the people were primitive farmers naturally interested in fertility cults. Dionysus was the god of fertility who only later came to be associated with wine and the divine madness it produces. He assumed the form of a man or a bull and his worship by the time it arrived in Greece became associated with women (as was the case in most of the Mystery Religions) who spent nights on the hills dancing and possibly drinking wine in order to stimulate ecstasy, an unpleasant aspect of the cult was the tearing to pieces of wild animals whose flesh was eaten raw. Although the cult was disapproved of by the orthodox and, needless to say, by husbands, it existed for a long time. This primitive and savage religion in time was modified by that attributed to Orpheus whose cult was more spiritualised, ascetic, and substituted mental for physical intoxication. Orpheus may have been a real person or a legendary hero and he, too, is supposed to have come from Thrace, but his name indicates that he, or the movement associated with him, came from Crete and originally from Egypt, which seems to have been the source of many of its doctrines. Crete, it must be remembered, was the island through which Egypt influenced Greece in other respects. Orpheus is said to have been a reformer who was torn to pieces by the Maenad worshippers of Dionysus. The Orphics believed in the transmigration of souls and that the soul after death might obtain either eternal bliss or temporary or permanent torment according to its way of life upon earth. They held ceremonies of purification and the more orthodox abstained from animal food except on special occasions when it was eaten ritually. Man is partly earthly, partly heavenly, and a good life increases the heavenly part so that, in the end, he may become one with Bacchus and be called a "Bacchus." The religion had an elaborate theology (*see* **Section H, 117–128**). As the Bacchic rites were reformed by Orpheus, so the Orphic rites were reformed by Pythagoras (*c* 582–*c* 507 B.C.) who introduced the mystical element into Greek philosophy which reached its heights in Plato. Other elements entered Greek life from Orphism. One of these was feminism which was notably lacking in Greek civilisation outside the Mystery Religions. The other was the drama which arose from the rites of Dionysus.

The mysteries of Eleusis formed the most sacred part of the Athenian state religion, and it is clear that they had to do with fertility rites also, for they were in honour of Demeter and Persephone and all the myths speak of them as being associated with the supply of corn to the country (*see* **Section H, 110–116**).

Without being provocative, it is accepted by most anthropologists and many theologians that Christianity, just as it accepted elements of Gnosticism and Mithraism, accepted elements from the Mystery Religions as they in turn must have done from earlier cults. The miraculous birth, the death and resurrection, the sacramental feast of bread and wine, symbolising the eating of the flesh and drinking of the blood of the god, all these are common elements in early religions and not just in one. None of this means that what we are told about Jesus is not true, but it surely does mean: (*a*) that Christianity was not a sudden development but had its predecessors; (*b*) that the early Church absorbed many of the elements of other religions; (*c*) that perhaps Jesus Himself made use of certain symbols which He knew had a timeless significance to man and invested them with a new meaning.

Orthodox Eastern Church. There are two groups of Eastern churches: (1) those forming the Orthodox Church dealt with here which include the ancient Byzantine patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the national churches of Russia, Greece, Yugoslavia, Bulgaria, Rumania, etc. (although Orthodox communities exist all over the world and are no longer confined to geographical areas); (2) the churches which rejected Byzantine orthodoxy during various controversies from the 5th to the 7th cent., notably the Coptic church (*q.v.*) and the Armenian church. Although all Orthodox churches share the same doctrine and traditions they are arranged as national independent bodies each with its own hierarchy. They do not recognise the pope, and the primacy of the patriarch of Constantinople is largely an honorary one. Although claiming to be the One Holy, Catholic, and Apostolic Church its alleged infallibility rests on universal agreement rather than on any one individual, and agreement over the faith comes from the Scriptures interpreted in the light of the Tradition. The latter includes dogmas relating to the Trinity, Christology, Mariology, and Holy Icons, the testimony of the Fathers (St. Athanasius, St. Basil, St. John Chrysostom, St. Cyril of Alexandria, etc.), the canons or rules as formulated by the Councils and the Fathers. The Orthodox Church did not take part in the great Western controversies about the Bible, nor, of course, in the Reformation. The total number of believers is not known, but some idea can be obtained from the fact that in the New World alone it has five million members.

Pantheism. *See* **God and Man.**

Papal Infallibility. The basis of papal infallibility is (*a*) that every question of morals and faith is not dealt with in the Bible so it is necessary that there should be a sure court of appeal in case of doubt, and this was provided by Christ when he established the Church as His Teaching Authority upon earth; (*b*) ultimately this idea of the teaching function of the Church shapes the idea of papal infallibility which asserts that the pope, when speaking officially on matters of faith or morals, is protected by God against the possibility of error. The doctrine was proclaimed in July 1870.

Infallibility is a strictly limited gift which does not mean that the pope has extraordinary intelligence, that God helps him to find the answer to every conceivable question, or that Catholics have to accept the pope's views on politics. He can make mistakes or fall into sin, his scientific or historical opinions may be quite

wrong, he may write books that are full of errors Only in two limited spheres is he infallible and in these only when he speaks officially as the supreme teacher and lawgiver of the Church, defining a doctrine that must be accepted by all its members When, after studying a problem of faith or morals as carefully as possible, and with all available help from expert consultants, he emerges with the Church's answer—on these occasions it is not strictly an answer, it is *the* answer.

This definition is compiled from Roman Catholic sources Let us see what the other side has to say Historically speaking, the Roman Catholic Church of the early 19th cent was at its lowest ebb of power Pope Pius IX, in fear of Italian nationalism, revealed his reactionary attitude by the feverish declaration of new dogmas, the canonisation of new saints, the denunciation of all modern ideals in the Syllabus of Errors, and the unqualified defence of his temporal power against the threat of Garibaldi It is not too much to say that everything regarded as important by freedom-loving and democratic people was opposed by the papacy at that time Thus in England, Lord Acton, the great historian, who was co-editor with Richard Simpson of the Catholic monthly, the *Rambler*, was forced to resign because his liberal views had given offence to Cardinal Wiseman, archbishop of Westminster Newman took over the paper but he was denounced by Rome and never forgiven for writing an article "on consulting the laity in matters of dogma" Acton and Simpson resumed publication only to be given the choice of coming out in favour of the pope's temporal power and against the British Liberal Party (Acton was a Liberal member of Parliament) or stopping publication The *Rambler* stopped, but was replaced by the *Home and Foreign Review*, in the first number of which reference was made to the famous 16th cent adventurer Pierluigi Farnese who was (correctly) referred to as the son of Pope Paul III The hierarchy was furious because the peculiar Catholic sense of propriety ordains that Farnese be referred to as the Pope's "nephew" Acton's struggles against the hierarchy were in vain and the "Ultramontanes" won when in 1870, after a long and sordid struggle, the Vatican Council, convened by Pius IX, pronounced the definition of his infallibility at the same time that his temporal power was falling in pieces about his ears There is good evidence that Cardinal Manning did his best to get Acton out of the Church, just as Dollinger, a German priest and famous historian of the Church, was excommunicated because, like many others, he refused to accept the new dogma If, as the Catholic statement above claims, papal infallibility is a logical extension of the past history of the Church, it is strange that the greatest Catholic scholar of the age failed to observe it It is difficult not to doubt that there was some connection between the pronouncement of the pope's infallibility and his simultaneous loss of temporal power

Paris School of Psychotherapy. The Paris school is important because it was the school of the famous French neurologist Jean Charcot (1825–93), teacher of Sigmund Freud (1856–1939) and Pierre Janet (1859–1947) At a time when hypnosis and the neurosis known as hysteria were very much "in the air," and Liébeault and his colleagues (*see* **Nancy School**) were regarding hysteria as a condition which was produced by autosuggestion, Charcot was maintaining the opposite view Hypnosis, or the ability to be hypnotised, was, in his view, a symptom of a hysterical personality, and hysteria had a physiological basis

Charcot was a highly controversial figure and his demonstrations were famous, if to some verging on the notorious, he aroused much antagonism among Roman Catholics by stating that faith cures at Lourdes were actually cases of hysteria and not, therefore, miraculous since they could equally well be cured by himself However, he regarded hysteria as a sign of hereditary degeneration. His supposed words, "You will always find sex at the root of the trouble" and his pupil Janet's evidence that forgotten (or, as we should now say, repressed) traumatic events lay behind the symptoms which would go when the event was allowed expression, had a potent influence on the young Freud who made the uncovering of the past and the importance of sex the foundations of psychoanalysis (*see* **Section F, Part III**). Janet's belief was that hysteria is due to dissociation or imperfect integration of the personality. Modern belief is that Charcot was wrong about the physical basis of hysteria, wrong about the pathological significance of hypnosis, but right on the whole about the importance of sexual problems in neurosis

Parsees. *See* **Zoroastrianism.**

Paulicians, a Christian heretical sect which derives its name not from Paul the Apostle but from Paul of Samosata who was patriarch of Antioch, 260–72 His followers, the "Pauliani," were condemned for their "Adoptionist" (*q v*) attitude by the Council of Nicaea (325) Originally wide-spread in Anatolia, especially in Armenia from the 5th cent onwards, they were cruelly persecuted by the Byzantine emperors and were deported (*c* 755) to the Balkans to garrison that part of the East Roman empire Elsewhere in this section the Albigenses or Cathari are mentioned, the Paulicians form part of their spiritual ancestry It is debatable whether the "Adoptionist" doctrines professed by the Albigenses came from the Balkan Bogomils, through the Crusaders, or from the north of Spain, where there was an "Adoptionist" movement in the late part of the 8th cent The evidence seems to be in favour of the Balkan influence but it should be noted that although the Bogomils were influenced by the Paulicians and the Manichaeans, the Paulicians themselves repudiated Manichaeanism An authentic liturgical book of the Paulicians—*The Key of Truth*—was discovered in 1891 in Echmiadzin where the Armenian historical archives were kept This manuscript throws new light on the heresy

Pavlovian theory. *See* **Behaviourism.**

Pelagian heresy. *See* **Determinism and Free-will**

Peripatetic philosophers, a name given to the followers of Aristotle derived from the philosopher's habit of walking up and down as he expounded his theories

Phrenology, a psychological "school" founded in 1800 by two Germans, Franz Josef Gall and Johann Gaspar Spurzheim Gall was an anatomist who believed there to be some correspondence between mental faculties and the shape of the head He tested these ideas in prisons and mental hospitals and began to lecture on his findings, arousing a great deal of interest throughout both Europe and America, where his doctrines were widely accepted Phrenology became fashionable, and people would go to "have their bumps read" as later men and women of fashion have gone to be psychoanalysed

Roughly speaking, Gall divided the mind into thirty-seven faculties such as destructiveness, suavity, self-esteem, conscientiousness, and so on, and claimed that each of these was located in a definite area of the brain He further claimed that the areas in the brain corresponded to "bumps" on the skull which could be read by the expert, thus giving a complete account of the character of the subject In fact, (*a*) no such faculties are located in the brain anywhere for this is simply not the way the brain works, (*b*) the faculties described by Gall are not pure traits which cannot be further analysed and are based on a long outdated psychology, (*c*) the shape of the brain bears no specific relationship to the shape of the skull Phrenology is a pseudo-science, there is no truth in it whatever. But, even so, like astrology, it still has its practitioners

Physiognomy. *See* **Characterology.**

Pietism, a movement for reviving piety in the Lutheran Church of the 17th cent.

Plymouth Brethren, a religious sect founded by John Nelson Darby, a minister of the Protestant Church of Ireland, and Edward Cronin, a former Roman Catholic, in 1827. Both were dissatisfied with the lack of spirituality in their own and other churches and joined together in small meetings in Dublin every Sunday for "the breaking of bread." Soon the movement

began to spread through Darby's travels and writings and he finally settled in Plymouth, giving the popular name to the "Brethren" Beginning as a movement open to all who felt the need to "keep the unity of the Spirit," it soon exercised the right to exclude all who had unorthodox views and split up into smaller groups Among these the main ones are the "Exclusives," the Kellyites, the Newtonites, and "Bethesda" whose main differences are over problems of church government or prophetical powers, some of these are further split among themselves.

The original views of Darby were somewhat as follows Christianity has fallen from New Testament purity and all Christendom and every Church is corrupt and has incurred God's displeasure, notably by establishing ministerial offices which hinder the believer's approach to God Ministers should not be officials but possess special gifts ("Charismata") granted from above and assigned by the Holy Ghost according to his will, these Charismata have no connection whatever with any official posts although in some cases they may coincide with them The whole doctrine of the Brethren is based on the need for *direct* access to God and they claim that any intermediate agency such as priests or ministers or presbyters is not only a hindrance but a sin Churches which have such are corrupt and it is the believer's duty to withdraw from them (not necessarily in the physical sense, but into himself, since corruption in a Church does not necessarily demand cessation of brotherhood with its members) It is quite possible for members of the Brethren to retain their former allegiance, although it is extremely uncommon

The most objectionable feature of the sect, if not a unique one, is their confidence that not only do they possess the sole certainty that all others are morally corrupt Readers of *Father and Son* by Sir Edmund Gosse, which describes life with his father, the eminent naturalist Philip Gosse, who belonged to the Brethren, will recall how this basically kind, honest, and learned man was led through their teachings to acts of unkindness (*e g*, in refusing to allow his son and other members of his household to celebrate Christmas and throwing out the small tokens they had secretly bought), and intellectual dishonesty (*e g*, in refusing for religious reasons alone to accept Darwinism when all his evidence pointed towards it) A religious sect that is capable of producing such perversions of human nature has not much to commend it, although a number of other eminent men have belonged to the Brethren

Poltergeist, allegedly a noisy type of spirit which specialises in throwing things about, making loud thumpings and bangings, and occasionally bringing in "apports," *i e*, objects from elsewhere Most so-called poltergeist activities are plain frauds, but the others are almost invariably associated with the presence in the house of someone (often, but not always a child) who is suffering from severe mental conflicts usually of a sexual nature The inference is that those activities which are not simply fraudulent are either due to some unknown influence exuded by such mentally abnormal people, or that they are actually carried out by ordinary physical means by such people when in a state of hysterical dissociation—*i e*, unconsciously. The second hypothesis is much the more probable. *See* **Psychic Research.**

Polytheism. *See* **God and Man.**

Positivism, also known as the **Religion of Humanity,** was founded by Auguste Comte (1798–1857), a famous mathematician and philosopher born in Montpellier, France His views up to the end of the century attracted many and it would have been impossible throughout that time to read a book on philosophy or sociology that did not mention them, but today his significance is purely of historical interest In his *Cours de Philosophie Positive* (1830) he put forward the thesis that mankind had seen three great stages in human thought (1) the theological, during which man seeks for supernatural causes to explain nature and invents gods and devils. (2) the metaphysical, through which he thinks in terms of philosophical and metaphysical abstractions; (3) the last positive or scientific stage when he will proceed by experiment and objective observation to reach in time "positive truth"

Broadly speaking, there is little to complain of in this analysis, for there does seem to have been some sort of general direction along these lines However, Comte was not satisfied with having reached this point and felt that his system demanded a religion and, of course, one that was "scientific" This religion was to be the worship of Humanity in place of the personal Deity of earlier times, and for it he supplied not only a Positive Catechism but a treatise on Sociology in which he declared himself the High Priest of the cult Since, as it stood, the religion was likely to appear somewhat abstract to many, Comte drew up a list of historical characters whom he regarded as worthy of the same sort of adoration as Catholics accord to their saints The new Church attracted few members, even among those who had a high regard for Comte's scientific work, and its only significant adherents were a small group of Oxford scholars and some in his own country Frederic Harrison was the best-known English adherent and throughout his life continued to preach Comtist doctrines in London to diminishing audiences

Pragmatism, a typically American school of philosophy which comes under the heading of what Bertrand Russell describes as a "practical" as opposed to a "theoretical" philosophy Whereas the latter, to which most of the great philosophical systems belong, seeks disinterested knowledge for its own sake, the former (*a*) regards action as the supreme good, (*b*) considers happiness an effect and knowledge a mere instrument of successful activity

The originator of Pragmatism is usually considered to have been the psychologist William James (1842–1910) although he himself attributed its basic principles to C S Peirce. The other famous Pragmatist is Dr John Dewey, best-known in Europe for his works on education (for although American text-books on philosophy express opinions to the contrary, few educated people in Europe have taken the slightest interest in Pragmatism and generally regard it as an eccentricity peculiar to Americans)

The basic source of Pragmatism is William James's book *The Will to Believe* (1896) in which he points out that we are often compelled to take a decision where no adequate theoretical grounds for a decision exist, for even to do nothing is to decide Thus in religion we have a right to adopt a believing attitude although not intellectually fully convinced We should believe truth and shun error, but the failing of the sceptical philosopher is that he adheres only to the latter rule and thus fails to believe various truths which a less cautious man will accept If believing truth and avoiding error are equally important, then it is a good idea when we are presented with an alternative to believe one of the possibilities at will, since we then have an even chance of being right, whereas we have none if we suspend judgment The function of philosophy, according to James, is to find out what difference it makes to the individual if a particular philosophy or world-system is true. "An idea is 'true' so long as to believe it is profitable to our lives," and, he adds, "the true is only the expedient in our way of thinking . . in the long run and on the whole of course" Thus "if the hypothesis of God works satisfactorily in the widest sense of the word, it is true" Bertrand Russell's reply to this assertion is "I have always found that the hypothesis of Santa Claus 'works satisfactorily in the widest sense of the word', therefore 'Santa Claus exists' is true although Santa Claus does not exist" Russell adds that James's concept of truth simply omits as unimportant the question whether God really *is* in His heaven, if He is a useful hypothesis that is enough "God the Architect of the Cosmos is forgotten; all that is remembered is belief in God, and its effects upon the creatures inhabiting our petty planet. No wonder the Pope condemned the pragmatic defence of religion."

Predestination. *See* **Calvinism.**

Presbyterianism, a Protestant denomination in

which the ministry consists of presbyters who are all of equal rank It is the Church of Scotland and the doctrinal standards are contained in the Westminster Confession (1647) which is, in general, accepted by English, Scottish, and American Presbyterians as the most thorough and logical statement in existence of the Calvinist creed

The Reformation in Scotland was preceded by the same sort of awareness of the moral corruption of the Roman Church as had happened elsewhere, but for various political and emotional reasons, which need not be discussed here, the majority of the Scottish people (unlike the English who had been satisfied with the mere exchange of Crown for Pope) were determined on a fundamental change of doctrine, discipline, and worship, rather than a reform of manners The church preachers had learned their Protestantism not from Luther but from Calvin and their leader John Knox had worked in Geneva with Calvin himself and was resolved to introduce the system into Scotland In 1557 the "Lords of the Congregation" signed the Covenant to maintain "the blessed Word of God and his congregation" against their enemies, and demanded the right to worship as they had chosen However, the real date of the Scottish Reformation is August 1560 when Mary of Guise (the regent for Mary Queen of Scots who was not yet of age) died and the Estates met to settle their affairs without foreign pressure, the Confession of Faith was drawn up and signed by Knox and five other ministers and almost unanimously adopted by the Estates

The ideas on which the Reformed Kirk was based are found in the Confession, the Book of Discipline, and Knox's Liturgy They are strongly anti-papal, referring to the Roman Church as the "Kirk malignant" (in common talk it was, and still is, quite usual to describe it as "the Whore of Babylon"). Apostolic Succession and Transubstantiation are repudiated, Christ is the sole head of the Kirk, the papist priests are not ministers at all and the Mass is a blasphemy Knox's Liturgy, the same as that used in Geneva but translated into English, was used until Laud's attempt to force an Anglican liturgy on the Kirk led to an abandonment of both in favour of "free prayers" The Book of Discipline contains elaborate rules for everything connected with church affairs, the state was recognised as coequal with the Kirk but there were tendencies for the Kirk to demand more equality than the state was prepared to give

The religion is based on the Bible as the Word of God and Old and New Testaments are equally inspired (in fact there was a tendency to quote from the Old Testament rather than the New) The church order is based on the equality of the ministers who are elected by their own flock after they have been tested for intelligence, learning, and character, and the rest of Kirk affairs in the individual church are looked after by the elders, who are in charge of spiritual and moral affairs, and the deacons, who are in charge of the funds Both elders and deacons are laymen elected by the congregation The public rebuke of offenders used to be a feature of the Scottish Kirk (Robert Burns frequently had to mount the "creepie chair" or stool of repentance), but one has not heard of it recently, although the moral transgressions of its members are the concern of the congregation The General Assembly composed of ministers and laymen, and meeting once a year, is the policy-forming body of the Kirk

A number of attempts were made from time to time by England to foist episcopacy on Scotland, under James I, Charles I, Charles II (under whom the Covenanters were hunted down, executed and dragooned, over a period of twenty-five years) However, since the union of the two countries in 1707 every new sovereign as his first official act must take an oath to "maintain the government, worship, rights, and privileges of the Church of Scotland"

Protestant, the name first applied to those who favoured the cause of Martin Luther and who protested against the intolerant decisions of the Catholic majority at the second Diet of Speyer (1529), revoking earlier decisions of the first Diet of Speyer tolerating the Reformers in certain cases (1526) In general the name "Protestant" is applied to those Churches which severed connection with Rome at the time of the Reformation. The essence of Protestantism is the acceptance by the individual Christian of his direct responsibility to God rather than to the Church. *See* **Lutheranism, Presbyterianism, Calvinism**

Psychic Research, the *scientific* study of so-called psychic phenomena as contrasted with spiritualism (*q v*) which is the cult of those who already believe in their supernatural nature It is obviously impossible here to summarise work that has been carried out (in Britain notably by the Society for Psychical Research, founded in 1882) on such subjects as mediumship, apparitions, telepathy and clairvoyance (discussed here separately under the heading of Telepathy), poltergeists (also discussed separately), levitation, and precognition

But the point at which we must begin is the human mind and the nature of scientific evidence and so far as these are concerned the following points may be made

(1) There is little use in discussing psychic phenomena until we realise that almost no human being—least of all one with strong convictions—is a completely trustworthy witness A person may be utterly honest in every other respect except that in which his convictions are involved.

(2) This does not mean that a witness is either telling the whole truth or is simply lying, for the following possibilities exist (*a*) he may be telling the truth (*b*) he may be consciously lying for motives of his own, (*c*) his recollections may be incorrect in discussing something that happened in the past, (*d*) he may really believe that he saw or heard what he said he did and may be telling the truth *as he experienced it*—*e g*, seeing a ghost—without realising that what he experienced is a product of his own unconscious mind, (*e*) there are various degrees of lying, for the mind has a natural tendency to add coherence and meaning to the only partly coherent events of the day, and it is a normal trait (consciously or unconsciously) to make a "good story" out of what originally were isolated and unconnected happenings, (*f*) even under the most favourable conditions the evidence of scientifically-trained people is not as good as it might be (cf the psychological experiment in which a class of students is suddenly exposed to a deliberately contrived scene, *e g*, two men eccentrically dressed rush into the lecture-room, exchange words, and have a quarrel—and the students are afterwards required to write down what they saw and heard, rarely 10 per cent being even 70 per cent correct as to what really happened)

(3) There are many aspects of "psychic" phenomena which are not "psychic" at all, but based on well-known scientific principles How many people, for example, know (*a*) that *every* physical illness has its psychological aspect, so that a person with chronic arthritis, let us say, may get up and walk for the first time in years after injection with a new drug which is later proved to be worthless or no better than aspirin (*e g*, cortisone), yet if a "spiritual healer" got the same results he would be acclaimed for his psychic powers, (*b*) that it is possible to be completely paralysed, totally blind or deaf, have total loss of sensation in some part of the body, have two or more personalities, *without any physical disease being present*, in the neurosis (cured daily by psychiatrists without mystery) known as hysteria

(4) It is possible under hypnosis, or self-hypnosis, to produce stigmata—*e g*., marks resembling the nail-prints of the Crucifixion on hands and feet, to produce blisters at will, spontaneous bleeding, and many of the phenomena usually described as miraculous, in the consulting room and by scientific means

(5) We all have more potent senses than we ordinarily realise We may not consciously know the number of steps leading to our flat, but can be made under hypnosis to tell Furthermore, there are people who are hypersensitive in hearing and vision (often without

being aware of it), so that in "thought-transference" experiments where they are sent to another room whilst others decide on some object or idea, they may subconsciously hear what is going on, or in card experiments in telepathy they may be able to read the face of the card reflected in the pupils of the "sender" opposite, or tell in a familiar pack which card is which from almost invisible differences on the backs of the cards

(6) Most of us have no idea of the mathematical laws of probability and are therefore likely to misinterpret the "mysteriousness" of phenomena Thus, suppose I have a "premonition" that someone has died and later find my feelings confirmed by the event, then I may not remember or know (a) that on many previous occasions I, in common with most other people, have had "premonitions" the vast majority of which did *not* come true, (b) that, on the last occasion I saw the person, or from things I may have heard, I may have unconsciously noted signs that all was not well and expected the event, (c) that the most "improbable" things happen quite normally (e g, during the last war a flying bomb fell through the roof of the British Museum and failed to explode, and some time later a second flying bomb fell *through the same hole* and likewise *failed to explode*), (d) that the chance of a pack of cards being dealt so that each of four persons receives a complete suit is exactly the same as the chance that any other combination of cards may come up

(7) That collective hallucinosis does occur (it would be invidious to mention in detail certain "miraculous happenings" which might hurt the religious susceptibilities of many, but we are entitled to ask how it is possible for the sun to stand still in the sky in the presence of thousands of people collected in a particular area when it is seen nowhere else in the world and has been noted by no astronomical laboratory?)

(8) Mediums have been proved to be prepared to do the most extraordinary things in order to deceive a suggestible audience seated in semi-darkness—e g, the so-called "ectoplasm" (a supposedly psychic substance or materialisation) which exudes from the medium's body has been found before the seance, as have "apports" or objects apparently appearing from nowhere, half-way down the medium's throat or in the stomach ready to be regurgitated, and even in other bodily apertures

It is not maintained that psychic phenomena do not happen, but that we must be extremely cautious in accepting the evidence of our own, or even more, other people's, senses, and much less free in our interpretation of what has been observed really means *See* **Poltergeist, Telepathy, Spiritualism**

Psychoanalysis *See* **Section F, Part III**

Pyrrhonism, a sceptical philosophy which doubts everything

Q

Quakers *See* **Friends, The Society of.**

Quartodecimani, an early Christian community who celebrated the Easter festival on the 14th day of the month, when the Jews celebrated their Passover In consequence of the confusion caused, the practice was condemned by the Council of Nicaea in 325

Quietism, a doctrine of extreme asceticism and contemplative devotion, embodied in the works of Michael Molinos, a 17th cent Spanish priest, and condemned by Rome It taught that the chief duty of man is to be occupied in the continual contemplation of God, so as to become totally independent of outward circumstances and the influence of the senses Quietists taught that when this stage of perfection is reached the soul has no further need for prayer and other external devotional practices Similar doctrines have been taught in the Moslem and Hindu religions. *See* **Yoga.**

R

Racism, the doctrine that one race is inherently superior or inferior to others, one of the bases of racial prejudice It has no connection whatever with the study of race as a concept, or the investigation of racial differences, which is a science practised by the physical anthropologist (who studies physical differences), or the social anthropologist (who studies cultural differences) Racism is simply a vulgar superstition believed in by the ignorant or mentally unbalanced, and it may be categorically stated as a scientific fact that racial superiority is a myth believed in by no scientist of repute There are, therefore, only two questions which it is necessary to answer (1) If no race is superior to any other, why are there obvious differences between the backward and the technically advanced peoples? (2) If there are no inherent differences between races, then why does racial prejudice exist? Both of these are, strictly speaking, questions to which the scientists must give an answer, the former is answered in **Section F, Part III**, the latter is dealt with in this section under the heading of **Anti-semitism**

Ranters, a derisive term for the Primitive Methodists (*see* **Methodism**)

Rationalism is defined as "the treating of reason as the ultimate authority in religion and the rejection of doctrines not consonant with reason" In practice, rationalism has a double significance (1) the doctrine as defined above, and (2) a 19th cent movement which was given to what was then known as "free-thought," "secularism," or agnosticism—i e, it was in the positive sense anti-religious and was represented by various bodies such as the Secular Society, the National Secular Society, and the Rationalist Press Association (founded in 1899)

In the first sense, which implies a particular philosophical attitude to the universe and life, rationalism is not easy to pin down although, at first sight, it would appear that nothing could be simpler Does it mean the use of pure reason and logic or does it mean, on the other hand, the use of what is generally called the "scientific method" based on observation (i e, the evidence of our senses) and experiment? If we are thinking in terms of the use of pure reason and logic then the Roman Catholic Church throughout most of its history has maintained, not that the whole truth about religion can be discovered by reason, but as St Thomas Aquinas held, the basis of religion—e g, the existence of God—can be rationally demonstrated Nobody could have made more use of logic than the schoolmen of the Middle Ages, yet not many people today would accept their conclusions, nor would many non-Catholics accept St Thomas's proofs of the existence of God even when they themselves are religious The arguments of a first Cause or Prime Mover or the argument from Design on the whole leave us unmoved, partly because they do not lead us to the idea of a *personal God*, partly because we rightly distrust logic and pure reason divorced from facts and know that, if we begin from the wrong assumptions or premises, we can arrive at some very strange answers If the existence of a Deity can be proved by reason, then one can also by the use of reason come to the conclusions, or rather paradoxes, such as the following God is by definition all good, all knowing, all powerful—yet evil exists (because if it does not exist then it cannot be wrong to say "there is no God") But if evil exists, then it must do so either because of God (in which case He is not all good) or in spite of God (in which case He is not all powerful).

Arguments of this sort do not appeal to the modern mind for two historical reasons (1) many of us have been brought up in the Protestant tradition which—at least in one of its aspects—insists that we must believe in God by faith rather than by logic and in its extreme form insists on God as revealed by the "inner light", (2) our increasing trust in the scientific method by direct observation and experiment Thus, no matter what Aristotle or St. Thomas may say about a Prime Mover or a First Cause, we remain unconvinced since at least one scientific theory suggests that the universe did not have a beginning and if scientific investigation proved this to be so, then we should be entirely indifferent to what formal logic had to say

The secularist and rationalist movements of

the 19th cent. were anti-religious—and quite rightly so—because at that time there were serious disabilities imposed even in Britain by the Established Church on atheism or agnosticism and freedom of thought They are of little significance now because very little is left, largely thanks to their efforts, of these disabilities.

Finally, although most people are likely to accept the scientific method as the main means of discovering truth, there are other factors which equally make us doubt the value of "pure" logic and reason unaided by observation. The first of these is the influence of Freud which shows that much of our reasoning is mere rationalising—*e g*, we are more likely to become atheists because we hated our father than because we can prove that there is no God The second is the influence of a movement in philosophy which, in the form of logical positivism or logical analysis, makes us doubt whether metaphysical systems have any meaning at all To-day, instead of asking ourselves whether Plato was right or wrong, we are much more likely to ask whether he did anything but make for the most part meaningless noises Religion is in a sense much safer today than it ever was in the 19th cent when it made foolish statements over matters of science that could be *proved* wrong, now we tend to see it as an emotional attitude to the universe or God (a "feeling of being at home in the universe," as William James put it) which can no more be proved or disproved than being in love.

Realism is a word which has so many meanings, and such contradictory ones, in various spheres, that it is difficult to define We shall limit ourselves to its significance in philosophy In philosophy, "realism" has two different meanings, diametrically opposed (1) The most usual meaning is the one we should least expect from the everyday sense of the word—*i e.*, it refers to all those philosophies from Plato onwards which maintained that the world of appearance is illusory and that ideas, forms, or universals are the only true realities, belonging to the world beyond matter and appearance—the world of God or mind In early mediaeval times St Thomas Aquinas was the chief exponent of this doctrine which was held by the scholastics as opposed to the Nominalists (*q v*) (2) In its modern everyday meaning "realism" is the belief that the universe is real and not a creation of mind, that although all we really experience is the evidence of our senses there is a reality that causes the appearance, the "thing-in-itself" as Kant described it Material things may not really be what they appear to be (*e g*, a noise is not the "bang" we experience but a series of shock-waves passing through the atmosphere), yet, for all that, we can be sure that matter exists and it is very possible (some might add) that mind does not

Reformation, the great religious movement of the 16th cent, which resulted in the establishment of Protestantism In the previous century Wyclif, Hus, and others had sounded the warning note, and when later on Luther took up the cause in Germany, and Zwingli in Switzerland, adherents soon became numerous. The wholesale vending of indulgences by the papal agents had incensed the people, and when Luther denounced these things he spoke to willing ears After much controversy, the reformers boldly propounded the principles of the new doctrine, and the struggle for religious supremacy grew bitter They claimed justification (salvation) by faith, and the use as well as the authority of the Scriptures, rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints, and the headship of the Pope Luther was excommunicated But the Reformation principles spread and ultimately a great part of Germany, as well as Switzerland, the Low Countries, Scandinavia, England, and Scotland were won over to the new faith In England Henry VIII readily espoused the cause of the Reformation, his own personal quarrel with the Pope acting as an incentive Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated *See* **Lutheranism, Calvinism, Presbyterianism, Baptists, Methodism.**

Reincarnation, the transmigration of souls *See* **Immortality, Hinduism, Buddhism.**

Renaissance is defined in the *Oxford English Dictionary* as· "The revival of art and letters, under the influence of classical models, which began in Italy in the 14th century" It is a term which must be used with care for the following reasons: (1) Although it was first used in the form *rinascita* (re-birth) by Vasari in 1550 and people living at that time certainly were aware that something new was happening, the word had no wide currency until used by the Swiss historian Jacob Burchardt in his classic *The Civilization of the Renaissance in Italy* (1860) (2) The term as used today refers not only to art in its widest sense but to a total change in man's outlook on life which extended into philosophical, scientific, economic, and technical fields (3) Spreading from Italy there were renaissance movements in France, Spain, Germany, and northern Europe, all widely different with varying delays in time As the historian Edith Sichel says "Out of the Italian Renaissance there issued a new-born art, out of the Northern Renaissance there came forth a new-born religion There came forth also a great school of poetry, and a drama the greatest that the world had seen since the days of Greece The religion was the offspring of Germany and the poetry that of England"

The real cause of the Renaissance was not the fall of Constantinople, the invention of printing, the discovery of America, though these were phases in the process, it was, quite simply, money The rise of a new merchant class gave rise to individualist attitudes in economic affairs which prepared the way for individualism and humanism The new wealthy class in time became patrons of the arts whereas previously the Church had been the sole patron and controller Thus the artist became more free to express himself, more respected, and being more well-to-do could afford to ignore the Church and even, in time, the views of his patrons

It is true that art continued to serve to a considerable extent the purposes of faith, but it was judged from the standpoint of art Mediaeval art was meant to elevate and teach man, Renaissance art to delight his senses and enrich his life From this free and questioning spirit acquired from economic individualism came the rise of modern science and technology, here Italy learned much from the Arab scholars who had translated and commented upon the philosophical, medical, and mathematical texts of antiquity, while denying themselves any interest in Greek art and literature Arabic-Latin versions of Aristotle were in use well into the 16th cent The Byzantine culture, though it had preserved the Greek tradition and gave supremacy to Plato, had made no move forward But the Greek scholars who fled to Italy after the fall of Constantinople brought with them an immense cargo of classical manuscripts The recovery of these Greek masterpieces, their translation into the vernaculars, and the invention of printing, made possible a completer understanding of the Greek spirit It was the bringing together of the two heritages, Greek science, and Greek literature, that gave birth to a new vision But it was not only Aristotle and Plato who were being studied but Ovid, Catullus, Horace, Pliny and Lucretius What interested Renaissance man was the humanism of the Latin writers, their attitude to science, their scepticism

The period *c* 1400–1500 is known as the **Early Renaissance.** During this time such painters as Masaccio, Uccello, Piero della Francesca, Botticelli, and Giovanni Bellini were laying the foundations of drawing and painting for all subsequent periods including our own They concerned themselves with such problems as anatomy, composition, perspective, and representation of space, creating in effect a grammar or textbook of visual expression The term **High Renaissance** is reserved for a very brief period when a pure, balanced, classical harmony was achieved and artists were in complete control of the techniques learned earlier The High Renaissance lasted only from *c* 1500 to 1527 (the date of the sack of Rome), yet that

interval included the earlier works of Michelangelo, most of Leonardo's, and all the Roman works of Raphael

Ritualism, a tendency which, during the 19th cent., developed in the High Church section of the Church of England to make use of those vestments, candles, incense, etc. which are usually regarded as features of the Church of Rome Since some opposition was aroused, a Ritual Commission was appointed in 1904 to take evidence and try to find some common basis on which High and Low Church could agree with respect to ceremonial The report of 1906 in effect recommended the giving of greater powers to bishops to suppress objectionable practices Although they are often associated together, it is worth while pointing out that there was no special connection between the Oxford Movement or Tractarians (*q v*) and Ritualism because Pusey disliked ritual and even Newman, who eventually went over to Rome, held extremely simple services at his church of St Mary's

Roman Catholic Church, the Christian organisation which acknowledges the Pope as the lawful successor of St Peter, the apostle appointed by Christ to be the head of His Church Every Roman Catholic, in whatever part of the world he finds himself, says "I believe whatever the Holy Catholic Church proposes for my belief" *See* **Catholicism, Papal Infallibility.**

Romanticism. *See* **Section L.**

Rotarianism. The Rotary Club is primarily an American association but has many members in Britain and presumably elsewhere since all Rotary Clubs are united in an international organisation It consists of groups of business and professional men formed with the purpose of serving their community and humanity in general The name is derived from the clubs entertaining in rotation and its badge, the blue and gold cog-wheel, is familiar

S

Sabellian heresy During the 4th cent great controversies raged within the Christian Church over the divinity of Jesus Christ Arius (*see* **Arianism**) denied Christ's divinity and maintained that the Father alone was truly divine This doctrine was condemned at the Council of Nicaea (325), Arius being opposed by Athanasius who held the now orthodox view of the Trinity which was reaffirmed at the Council of Constantinople (381) The Sabellians, named after their founder Sabellius (*fl* 215), a Libyan priest and theologian, held the view that God is indivisible but with three roles, appearing successively as the Father (the creator), as the Son (the redeemer), and as the Holy Spirit (the divine spirit within men) This view which makes the person of Jesus Christ ultimately an illusion, was condemned

Salvation Army. The religious movement which in 1878 became known by this name arose from the Christian Mission meetings which the Rev William Booth and his devoted wife had held in the East End of London for the previous thirteen years Its primary aim was, and still is, to preach the gospel of Jesus Christ to men and women untouched by ordinary religious efforts The founder devoted his life to the salvation of the submerged classes whose conditions at that time were unspeakably dreadful Originally his aim had been to convert people and then send them on to the churches, but he soon found that few religious bodies would accept these "low-class" men and women So it was that social work became part of their effort Practical help, like the provision of soup-kitchens, accompanied spiritual ministration. Soon, in the interests of more effective "warfare" against social evils, a military form of organisation, with uniforms, brass bands, and religious songs, was introduced Its magazine *The War Cry* gave as its aim "to carry the Blood of Christ and the Fire of the Holy Ghost into every part of the world" There were persecutions, mobs, sometimes encouraged by the police, assaulted the Salvationists who, although not the aggressors, were often punished by the magistrates In a single year 56 buildings belonging to the Army were wrecked, and (excluding men) over 250 women were seriously hurt General Booth saw with blinding clarity that conversion must be accompanied by an improvement of external conditions Various books had earlier described the terrible conditions of the slums, but in 1809 he produced a monumental survey entitled *In Darkest England and the Way Out* There is insufficient space to go into its proposals, but from that time forward the Army was accepted and its facilities made use of by the authorities. Today the Army's spiritual and social activities have spread to countries all over the world; every one no matter what class, colour, or creed he belongs to is a "brother for whom Christ died" After his death in 1912, the General was succeeded by his son Bramwell

Sandemanians or Glassites, an obscure religious sect whose sole claim to fame is that one of its members was the great Michael Faraday, founder of the science of electromagnetism, who never failed to attend its Sunday services

Sceptics. From Thales of Miletus (*c* 624–565 B C) to the Stoics in the 4th cent B C. philosophers had been trying to explain the nature of the universe, each one produced a different theory and each could, apparently, prove that he was right. This diversity of views convinced the Sceptic school founded by Pyrrho (*c* 360–270 B C) that man is unable to know the real nature of the world or how it came into being In place of a futile search for what must be for ever unknowable, the Sceptics recommended that men should be practical, follow custom, and accept the evidence of their senses

Schoolmen. From the time of Augustine to the middle of the 9th cent philosophy, like science, was dead or merely a repetition of what had gone before But about that time there arose a new interest in the subject, although (since by then Western Europe was entirely under the authority of the Catholic Church) the main form it took was an attempt to justify Church teaching in the light of Greek philosophy. Those who made this attempt to reconcile Christian beliefs with the best in Plato and Aristotle were known as "schoolmen" and the philosophies which they developed were known as "scholasticism" Among the most famous schoolmen must be counted John Scotus Erigena (*c* 800–*c* 877), born in Ireland and probably the earliest, St Anselm, archbishop of Canterbury (1033-1109), the great Peter Abelard whose school was in Paris (1079–1142); Bernard of Chartres, his contemporary, and the best-known of all, St Thomas Aquinas of Naples (1225-74), who was given the name of the "Angelic Doctor"

The philosophies of these men are discussed under various headings (**God and Man, Determinism and Free-will**), but being severely limited by the Church their doctrines differed from each other much less than those of later philosophical schools However, one of the great arguments was between the orthodox Realists (*q v.*) and the Nominalists (*q v*) and a second was between the Thomists (or followers of St Thomas Aquinas) and the Scotists (followers of John Duns Scotus—not to be confused with John Scotus Erigena) The two latter schools were known as the Ancients, whilst the followers of William of Occam, the Nominalist, were known as the Terminalists All became reconciled in 1482 in face of the threat from humanism of which the great exponent was Erasmus of Rotterdam (1466–1536) who hated scholasticism

Shakers, members of a revivalist group, styled by themselves "The United Society of Believers in Christ's Second Appearing," who seceded from Quakerism in 1747 though adhering to many of the Quaker tenets. The community was joined in 1758 by Ann Lee, a young convert from Manchester, who had "revelations" that she was the female Christ: "Mother Ann" was accepted as their leader Under the influence of her prophetic visions she set out with nine followers for "Immanuel's land" in America and the community settled near Albany, capital of New York state. They were known as the "Shakers" in ridicule because they were given to involuntary movements in moments of religious ecstasy.

Central to their faith was the belief in the

dual role of God through the male and female Christ: the male principle came to earth in Jesus, the female principle, in "Mother Ann". Like the Quakers, they refused to take part in war but were willing to accept any peaceful demand by the government. The sexes were equal and women preached as often as men at their meetings which sometimes included sacred dances—nevertheless the two sexes, even in dancing, kept apart. They lived a celibate life. The sect became well-known in New York and New England. Their communistic way of living brought them economic prosperity, the Shakers becoming known as good agriculturists and craftsmen, noted for their furniture and textiles. After 1860, however, the movement began to decline and from a membership of some six thousand in 1826, few, if any, are active today.

Shiites or Shia, a heretical Moslem sect in Persia, opposed by the orthodox Sunnites. The dispute, which came almost immediately after the death of the Prophet and led to bitter feuding, had little to do with matters of doctrine as such, but with the succession. The details of this need not be gone into here. Suffice it to say that, after Mohammed's death, there were three possible claimants: Ali, the husband of his daughter Fatima, and two others, one of whom gave up his claim in favour of the other, Omar. The orthodox selected Omar, who was shortly assassinated, and the same happened to his successor as Ali was passed over again. The Shiites are those who maintain that Ali was the true vicar of the Prophet, and that the three orthodox predecessors were usurpers.

Shintoism, the native religion of Japan, primarily a system of nature and ancestor worship. Since the intellectual content of Shinto is negligible, it is unnecessary to go into its mythology which, very briefly, states that when heaven and earth began there were two beings—a god named Izanagi and a goddess named Izanami. These two gave birth to the islands of Japan. The goddess died, and subsequently her consort Izanagi gave birth (whilst washing his eyes and nose) to three deities: those of the Sun, Moon, and Storm. The first was named Amaterasu, the third Susanowo, after various quarrels between the brother and sister, one of the descendants of Amaterasu, Jimmu Tenno, became the first earthly emperor of Japan who acquired his position by conquest of the province of Yamato in central Japan (*i.e.*, the area south of modern Kyoto) where he set up his capital and built a palace. Thus the Japanese emperors are the ancestors of the Sun-goddess. The primary deities were, therefore, personifications of nature, and the worship of the Sun occupied a central position. After the introduction of Buddhism this crude polytheism became known as Shinto, *i.e.*, "the way of the gods". During the Tokugawa shogunate (*c.* 17th cent.) Confucianism became the orthodox religion of the state—largely because it lays so much emphasis on deference to authority, but neither Buddhism nor Shinto were set aside (by this time both had become interrelated). The authorities, however, regarded Buddhism as for the lower classes and alleged that in essentials Shinto and Confucianism were identical. Latterly, Shinto became increasingly tied up with patriotism and militarism and was increasingly taught in schools prior to the second world war. At the level of the Japanese home, Shinto is represented by the kamidana or "god-shelf" and the miniature Buddhist temple which are prayed to as enshrining the spirits of the family's ancestors. After the defeat of Japan in the second world war Hirohito disavowed his divinity.

Sikhism. The Sikh community of the Punjab, which has played a significant part in the history of modern India, came into being during a period of religious revival in India in the 15th and 16th cent. It was originally founded as a religious sect by Guru (teacher) Nanak (1469–1538) who emphasised the fundamental truth of all religions, and whose mission was to put an end to religious conflict. He condemned the formalism both of Hinduism and Islam, preaching the gospel of universal toleration, and the unity of the Godhead, whether He be called Allah, Vishnu, or God. His ideas were welcomed by the great Mogul Emperor Akbar (1542–1605). Thus a succession of Gurus were able to live in peace after Nanak's death, they established the great Sikh centre at Amritsar, compiled the sacred writings known as the *Adi Granth*, and improved their organisation as a sect. But the peace did not last long, for an emperor arose who was a fanatical Moslem, in face of whom the last Guru, Govind Singh (1666–1708), whose father was put to death for refusal to embrace Islam, had to make himself a warrior and instil into the Sikhs a more aggressive spirit. A number of ceremonies were instituted by Govind Singh, admission to the fraternity was by special rite, caste distinctions were abolished, hair was worn long, the word singh, meaning lion, was added to the original name. They were able to organise themselves into 12 *misls* or confederacies but divisions appeared with the disappearance of a common enemy and it was not until the rise of Ranjit Singh (1780–1839) that a single powerful Sikh kingdom was established, its influence only being checked by the English, with whom a treaty of friendship was made. After the death of Ranjit Singh two Anglo-Sikh wars followed, in 1845–46, and 1848–49, which resulted in British annexation of the Punjab and the end of Sikh independence. In the two world wars the Sikhs proved among the most loyal of Britain's Indian subjects. The partitioning of the continent of India in 1947 into two states, one predominantly Hindu and the other predominantly Moslem, presented a considerable problem in the Punjab, which was divided in such a way as to leave 2 million Sikhs in Pakistan, and a considerable number of Moslems in the Indian Punjab. Although they number less than 2 per cent. of the population (roughly 8 million) the Sikhs are a continuing factor in Indian political affairs because of their prolonged agitation for a separate Sikh-dominated state within the Union.

Socialism, a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality, using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign, colonial, social, and economic policies alike. The British Labour Party believes in peaceful and constitutional change to socialism by democratic methods based upon popular consent.

The word "socialism" first came into general use in England about 1834 in connection with Robert Owen's "village of co-operation" at New Lanark. About the middle of the 19th cent. Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns, and others founded a Socialist League in 1886. With the development of trade unions the socialist movement took a more practical trend. **Fabianism** (*q.v.*) associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw, aims at the gradual reorganisation of society by creating intelligent public opinion by education and legislation. The first time Labour Party members were returned to Parliament was in 1906, when 29 were elected. A democratic programme of planned economy and public ownership of certain vital industries and services were features of socialist government from 1945–51 together with a comprehensive system of social security. *See also* **Section C, Part I.**

Southcottians, followers of Joanna Southcott who died in 1814 shortly after announcing to them that (although aged over 50) she was about to give birth to a divine man named Siloh. In spite of the fact that she went through all the actions of a woman about to give birth it is not surprising that no Siloh appeared nor was she pregnant. She also announced that, 100 years after her death, great revelations would be made—but in 1914 people had other things to think about and no revelations were vouchsafed. Yet this unfortunate woman still has her followers who believe that Siloh will appear and that the "true" revelations will be made at some unspecified future date under the right conditions.

It is difficult to decide which is the stranger phenomenon, Joanna or her followers.

Spiritualism is a religion which requires to be distinguished from **psychical research** (*q.v.*) which is a scientific attempt carried on both by believers and non-believers to investigate psychic phenomena including those not necessarily connected with "spirits"—*e.g.*, telepathy or clairvoyance and precognition. As a religion (although for that matter the whole of history is filled with attempts to get in touch with the "spirit world") spiritualism begins with the American Andrew Jackson who in 1847 published *Nature's Divine Revelations*, a book which is still widely read although it bears traces of the period in which it was written. Thus reference is made to the theories of "Mesmerism" and "magnetic influence" which really belong to the period when hypnosis was described as Mesmerism after the name of its first modern exponent, Anton Mesmer (d. 1815). The division of man into body, soul, and spirit is accepted and it is supposed that the "soul" is simply a sublimation of the body, needing food which after digestion by the body is refined into a more ethereal form. It even takes the actual form of the body which in reality is merely the covering by which soul communicates with the outer world before passing the messages on to the spirit which is a process of the Divine in which it will ultimately be absorbed. As we grow older there is a gradual separation between spirit or soul and the body—a process which Davis claimed to have observed in the clairvoyant state. According to his observations, the soul, still retaining the form of the body from which it was separating, moved above it but was still joined by a tenuous stream of "vital electricity" which Davis compared with the umbilical cord and took some time to vanish. Death in this view is literally a birth-process from a lower to a higher plane.

The earth is surrounded by a series of spheres from lower to higher, and although these are spiritual it is claimed that their actual distance from the centre of the earth can be measured in ordinary miles or metres. Davis supposed that the passage from lower to higher spheres is accompanied by an increase in moral perfection until the spirit is ultimately absorbed in God. In the lower spheres, however, it still retains something of the material which enables mediums to enter into contact with it. Therefore nearly all spiritualist meetings include a séance, and for the rest, there are prayers, sermons, and hymns. There are ministers, lay officers, and mediums, the latter usually are "freelance" and move about from one church to another. It is, as most people are well aware, perfectly possible for capable and knowledgeable men and women to be either "spiritualists" or (more commonly) interested in spiritualism, but for the most part those who attend services are people who come seeking for proof that their loved ones are not dead but have "passed on" and such are unlikely to retain a critical attitude on the subject however hard-headed they may be in other respects. In spite, or perhaps because of this, the Spiritualist Church is one with an ever-increasing membership especially in Britain and America. It is not permitted for Roman Catholics to hold or practise spiritualist beliefs.

State and Man. Most of the early civilisations such as those of Egypt and Babylonia were theocratic, that is to say, they were arranged in a hierarchy with, at the peak, a king who was also an incarnation of the god. Needless to say, in such circumstances there was no room for philosophising about the nature of the state and the relationship which ought to exist between state and citizens. As usual, we have to turn to ancient Greece for the beginnings of thought about this problem. We do so as briefly as possible since in general it is only the later philosophers whose work has much contemporary interest and, in any case, most people today realise that the political philosophy of a particular time is bound to reflect the actual conditions prevailing then and as such is of mainly theoretical interest today.

The Greek Approach. The early pre-Socratic philosophers Democritus and the Pythagorean school, for example, held that the individual should subordinate himself to the whole; they had no doubt that the citizen's first duty was to the state. The Greeks until the time of Plato were not really thinking in terms of individual rights, nor had they given much thought to what form the state should take—they simply accepted it. The first great attempt to describe the ideal state is to be found in Plato's *The Republic* which is referred to elsewhere (*see* **Education**). His pupil Aristotle did not try to form a utopia but made many comments on the nature of government. Thus, while agreeing that the state was more important than any individual person, he distinguished between good and bad states, and pointed out that to the extent that the state does not enable its citizens to lead virtuous and useful lives it is evil. A good constitution must recognise the inequalities between human beings and confer on them rights according to their abilities; among these inequalities are those of personal ability, property, birth, and status, as freeman or slave. The best forms of rule were monarchy, aristocracy, and democracy, the worst forms—tyranny, oligarchy (or rule of a powerful few), and ochlocracy (or mob-rule). The later Greek thinkers of Hellenistic times held two opposed points of view. The Epicureans (*q.v.*) taught that all social life is based upon self-interest and we become members of a group for our own convenience, therefore there are no absolute rights and laws—what is good is what members decide at that time to be good, and when they change their minds the law must change too. Injustice is not an evil in any god-given sense; we behave justly simply because if injustice became the general rule, we ourselves should suffer. The Stoics (*q.v.*), on the other hand, held that the state must dominate the individual completely and everyone must carry out, first and foremost, his social duties and be willing to sacrifice everything for it; but the state of the Stoics was no narrowly national one, but one that strove to become a universal brotherhood.

The Christian Approach. The orthodox Christian view is expressed in St. Augustine's book *The City of God*. Here it is held that the church, as the worldly incarnation of the City of God, is to be supreme over the state, and the head of the church is to be supreme over secular rulers. In addition it must be recognised that, whilst the secular ruler can make mistakes, the church does not, since it is the representative of God's kingdom on earth.

The Secular State. During the Renaissance (*q.v.*) people began to think for themselves and the results of their cogitations were not always pleasant, for it was during this time that many rulers, petty and otherwise, were seeking absolute authority. Two notable thinkers at this stage were Niccolo Machiavelli (1469–1527) in Italy and Thomas Hobbes (1588–1679) in England, where, of course, the Renaissance arrived later in history. Both supported absolute monarchy against the former domination of the church. The name of Machiavelli has become a by-word for any behaviour that is cunning and unscrupulous, but he was not really as bad as he is usually painted. It is, indeed, true that in his book *The Prince* he showed in the greatest detail the methods by which a ruler could gain absolute control and destroy civic freedom, but this despotism was intended as merely a necessary intermediate stage towards his real idea which was a free, united Italian nation wholly independent of the church. Hobbes was a materialist whose thesis was that man is naturally a ferocious animal whose basic impulse is war and pillage and the destruction of whatever stands in his way to gain his desires. But if he allowed himself to behave in this way his life would be "nasty, brutish, and short" so he creates a society in which he voluntarily gives up many of his rights and hands them over to a powerful ruler in his own interest. But having done this he must obey, even when the ruler is unjust, as he has no right to complain because anything is better than a return to his natural state. The religion of the king must be the religion of the people and the only things no

ruler has the right to do is to cause a man to commit suicide or murder or to make him confess to a crime

Views of Locke: Live and Let Live. John Locke (1632–1704) disagreed with these views Man is naturally peaceful and co-operative and therefore social life comes readily to him He sets up an authority in order to preserve the group and that is why laws are made, but the function of the state is strictly limited to maintaining the public good and beyond this men are to be left free Therefore absolute power and the doctrine of the Divine Right of Kings were wrong because power ultimately rests with the people who have the right to make and break governments It is also wrong that those who make the laws should be able to execute them This is the important British doctrine of the separation of powers between the legislature and the executive which, in Britain and America, is regarded as one of the bases of democracy

Rousseau's Social Doctrine The only other views we need consider here are those of Jean-Jacques Rousseau (1712–78) and Herbert Spencer (1820–1903), since the views of the two important intervening figures, Hegel and Karl Marx, are dealt with elsewhere (*see* **Dialectical Materialism**) and after Spencer we come to a stage where political philosophy begins to merge with sociology and the social sciences Rousseau is a puzzling figure. On the one hand he has been hailed as the prophet of freedom and on the other as the father of modern totalitarianism His book *Social Contract* (1762) begins with the words "Man is born free, and everywhere he is in chains" He says that he is in favour, not merely of democracy, but of direct democracy in which everyone has to give his assent to all measures as in the Greek city-states and in Geneva, of which city he was a citizen (This method is still in force in respect of some measures in the Swiss cantons) Natural society is based on a "social contract" or mutual agreement and Rousseau speaks of a "return to nature" which would ensure the sovereignty of the people at all times Thus far, he seems to agree with Locke but soon we find that he is more akin to Hobbes, since (as we are learning in our own day) nothing is more tyrannical than the absolute rule of all the people (Public opinion is more Hitlerian than Hitler) As it turns out, then, the "social contract" consists in "the total alienation of each associate, together with all his rights, to the whole community" and "each of us puts his person and all his power in common under the supreme direction of the general will" Rousseau admired direct democracy in the small city-state, but if his doctrine is applied to large states, then the "general will" becomes absolute It is in this sense that he is regarded as the forerunner of totalitarianism Herbert Spencer is quoted only as an example of the inappropriate application of a biological theory to social issues Influenced by Darwin's thesis of natural selection, he saw in society a struggle in which the fittest survived and the less fit perished Each individual had the right to preserve himself, but in the case of human beings this depended upon group life in which, to some extent, each individual is limited by the rights of others But this should not go too far, and he condemned the socialism of J S Mill which (*a*) would give over-much protection to the unfit, and (*b*) would give the state powers which it has no right to since the best government is the least government In accordance with Darwinism free competition was essential

Stoics, the followers of Zeno, a Greek philosopher in the 4th cent B C, who received their name from the fact that they were taught in the Stoa Poikile or Painted Porch of Athens They believed that since the world is the creation of divine wisdom and is governed by divine law, it is man's duty to accept his fate Zeno conceived virtue to be the highest good and condemned the passions. (*See* **God and Man, State and Man, Determinism and Free-will** for a more detailed account of their beliefs)

Sunnites, the orthodox sect of Islam as contrasted with the Shiites or Shia (*q v*)

Swedenborgianism. The Church of the New Jerusalem, based on the writings of Emanuel Swedenborg (1688–1772), was founded by his followers eleven years after his death. The New Church is regarded by its members not as a sect but as a new dispensation bearing the same relationship to Christianity as Christianity does to Judaism

Syndicalism, a form of socialist doctrine which aims at the ownership and control of all industries by the workers, contrasted with the more conventional type of socialism which advocates ownership and control by the state Since syndicalists have preferred to improve the conditions of the workers by direct action, *e g.* strikes and working to rule, rather than through the usual parliamentary procedures, they have been closely related to anarchists (*q v*) and are sometimes described as anarcho-syndicalists Under syndicalism there would be no state, for the state would be replaced by a federation of units based on functional economic organisation rather than on geographical representation The movement had bodies in the United Kingdom, where guild socialism (*q v*) was strongly influenced by its doctrines, in France, Germany, Italy, Spain, Argentina, and Mexico, but these gradually declined after the first world war losing many members to the communists Fascism (*q v*) was also strongly influenced by the revolutionary syndicalism of Georges Sorel in making use of his concept of the "myth of the general strike" as an emotional image or ideal goal to spur on the workers, with Mussolini the "myth" became that of the state Mussolini was also influenced by Sorel's doctrine of violence and the justification of force Syndicalism had a certain influence in the Labour Party in its early days, but was crushed by men like Ernest Bevin who began to fear that by involving the workers in direct responsibility for their industries, it would put them at a disadvantage when bargaining for wages

T

Taoism, a religion which, although in a degenerate state, is still one of the great Eastern creeds. Its alleged founder, Lao-tze, is said to have been born in Honan about 604 B C, he is also said to be the author of the bible of Taoism, the *Tao-te-ching*, or in English *The Way of Life*, and to have disapproved of Confucius This, if true, would hardly be surprising, for Taoism is eminently a mystical religion recommending doing nothing and resisting nothing, whereas **Confucianism** (*q v*) is eminently a practical code of living and its founder insisted on intervening in everything to do with social life But the truth as revealed by modern scholarship is rather different We are told that the poems of the *Tao-te-ching* are anonymous and probably originated among recluses in lonely valleys long before the time of Confucius, they were collected and given form at some time late in the 3rd cent. B C and their authorship attributed to Lao-tze It is entirely possible that no such person ever existed (unlike Confucius, who certainly did), but if there were such a man he appears to have used a pseudonym since "Lao" is not a surname but an adjective meaning "old" and it was customary to attribute important works to old men on account of their supposed wisdom. Lao-tze simply means "the old philosopher," and although the *Tao-te-ching* is one of the most remarkable and instructive books ever written it is as anonymous as the Border Ballads

It is apparent that the religion learned both from the ancient Chinese mystics and from Brahmanism *Tao*, the Way, is impalpable, invisible, and incapable of being expressed in words But it can be attained by virtue, by compassion, humility, and non-violence Out of weakness comes true strength whereas violence is not only wrong but defeats its own ends. There is no personal God and such gods as men imagine are mere emanations of *Tao* which gives life to all things *Tao* is Being Works are worthless and internal renunciation is far better than anything that follows from the use of force because passive resistance convinces the other from within that he is in error, whereas violence only compels the external ap-

pearance of conviction whilst inwardly the individual is as before. "It is wealth to be content, it is wilful to force one's way on others"

Later Lao-tze became a divinity and indeed one of a Trinity each worshipped in the form of idols (which the founder had hated). Soon there was worship of the forces of nature the stars, the tides, the sun and moon, and a thousand other deities among whom Confucius was one The purest mysticism and wisdom had been utterly corrupted by contact with the world

Telepathy and Clairvoyance. Telepathy is the alleged communication between one mind and another other than through the ordinary sense channels Clairvoyance is the supposed faculty of "seeing" objects or events which, by reason of space and time or other causes, are not discernible through the ordinary sense of vision Such claims have been made from time immemorial but it was not until this century that the phenomena were investigated scientifically The first scientific studies were made by the Institute for Psychical Research A new era in experimentation began with the work of J B. Rhine at Duke University, North Carolina, and S G Soal of London University The most common technique is card guessing using a special pack of cards with the Zener symbols (circle, square, cross, wavy lines, star), thus giving the subject one chance in five of guessing correctly Although the results obtained have led to the conclusion that telepathic communication is a fact, scepticism still exists, partly because of criticism of the methods employed, the validity of the data obtained, and the assumptions drawn, and partly because telepathic theory appears to clash with existing scientific thought. Dr Rhine uses the term extra-sensory perception (abbreviated to ESP) to include telepathy, clairvoyance, and precognition His studies also include what is described as the PK effect or psychokinesis, the supposed influence of the human mind on the movements of physical bodies The Psi force is the term used for the faculty behind ESP and PK Reference should be made to the entry on **Psychical Research** in order to obtain the background relating to the various fallacies involved in accepting human evidence uncritically.

Theism *See* **God and Man**

Theosophy, a religious movement originated by Madame Helena Petrovna Blavatsky (1831–91) who founded the Theosophical Society in New York in 1875 and had as one of her main disciples Mrs Annie Besant (1847–1933), originally an assistant of Charles Bradlaugh, the well-known 19th cent atheist and secularist Theosophy accepts the doctrines of *karma* and reincarnation, and, like the Swedenborgians and spiritualists, holds that there are higher and lower planes in the life after death As in these other sects, the geography of this supernormal world is worked out in great detail

Tractarianism, a Catholic revival movement, also known as the **Oxford Movement** (not to be confused with the so-called Oxford Group), which had its beginnings at Oxford in 1833 The leaders included the Oxford high churchmen E B. Pusey, J. Keble and J. H Newman Through the *Tracts for the Times* (1833–41), a series of pamphlets which were sent to every parsonage in England, they sought to expose the dangers which they considered to be threatening the church from secular authority The immediate cause of the movement was the Reform Act (1832) which meant that the state was no longer in the safe keeping of Tories and Churchmen but that power was falling into the hands of Liberals and Dissenters They advocated a higher degree of ceremonial in worship nearer the Roman communion In *Tract 90* (the last) Newman showed how the Thirty-nine Articles themselves, which were regarded as the bulwark of Protestantism, could be made to square with Roman doctrine It was obvious which direction the movement was taking and the romanizing tendency was widely resented. In 1845 Newman went over to Rome. Pusey and Keble persisted in their efforts to secure recognition of Catholic liturgy and doctrine in the Anglican Church. Catholicism of the Anglican type (*i e*, Catholic in ritual, ceremony, and everything save submission to the Pope) is termed Anglo-Catholicism (*q v*)

Transmigration of Souls. *See* **Immortality, Buddhism, Hinduism**

Transubstantiation, the conversion in the Eucharist of the bread and wine into the body and blood of Christ—a doctrine of the Roman Catholic Church

Trotskyism, a form of communism supporting the views of Leon Trotsky, the assumed name of Lev Bronstein (1879–1940) who, in 1924, was ousted from power by Stalin and later exiled and assassinated in Mexico Trotsky held that excessive Russian nationalism was incompatible with genuine international communism and that Stalin was concentrating on the economic development of the Soviet Union to an extent which could only lead to a bureaucratic state with a purely nationalist outlook.

U

Unitarianism has no special doctrines, although clearly, as the name indicates, belief is in the single personality of God, *i e*, anti-trinitarian This general statement, however, can be interpreted with varying degrees of subtlety Thus unitarian belief may range from a sort of Arianism which accepts that, although Christ was not of divine nature, divine powers had been delegated to him by the Father, to the simple belief that Christ was a man like anyone else, and his goodness was of the same nature as that of many other great and good men. Unitarianism has never been popular, and has often been held in secret by men who professed, or at least belonged to churches which professed, more orthodox views The Toleration Act (1689) excluded Unitarians but from 1813 they were legally tolerated in England Nevertheless attempts were made to turn them out of their chapels on the ground that the preachers did not hold the views of the original founders of the endowments But this ended with the Dissenting Chapels Act of 1845 In America no such difficulties existed, and in the Boston of the 19th cent many of the great literary figures were openly unitarian both in belief and name *e g*, Emerson, Longfellow, Lowell, and Oliver Wendell Holmes

Utilitarianism, a school of moral philosophy of which the main proponents were J S Mill (1806–73) and Jeremy Bentham (1748–1832) Bentham based his ethical theory upon the utilitarian principle that the greatest happiness of the greatest number is the criterion of morality What is good is pleasure or happiness, what is bad is pain If we act on this basis of self-interest (pursuing what we believe to be our own happiness), then what we do will automatically be for the general good The serious failing of this thesis is (1) that it makes no distinction between the quality of one pleasure and another, and (2) that Bentham failed to see that the law might not be framed and administered by men as benevolent as himself J S Mill accepted Bentham's position in general but seeing its failings emphasised (1) that self-interest was an inadequate basis for utilitarianism and suggested that we should take as the real criterion of good the social consequences of the act, (2) that some pleasures rank higher than others and held that those of the intellect are superior to those of the senses. Not only is the social factor emphasised, but emphasis is also placed on the nature of the act.

Utopias. The name "utopia" is taken from a Greek word meaning "nowhere" and was first used in 1516 by Sir Thomas More (1478–1535) as the title of his book referring to a mythical island in the south Pacific where he sited his ideal society Since then it has been used of any ideal or fanciful society, and here a few will be mentioned (The reader may recall that Samuel Butler's 19th cent novel, describing an imaginary society in New Zealand where criminals were treated and the sick punished, was entitled *Erewhon* which is the word "nowhere" in reverse) It should be noted that not all utopias were entirely fanciful—*e g*, Robert Owen's and François Fourier's beliefs, although found to be impractical, were, in fact, tried out

Sir Thomas More. More wrote at a time

when the rise of the wool-growing trade had resulted in farming land being turned over to pasture and there was a great wave of unemployment and a rise in crime among the dispossessed More began to think in terms of the mediaeval ideal of small co-operative communities in which class interests and personal gain played a decreasing part, a society which would have the welfare of the people at heart both from the physical and intellectual points of view His utopia was one in which there was no private property, because the desire for acquisition and private possessions lay at the root of human misery There was, therefore, only common ownership of land and resources Each class of worker was equipped to carry out its proper function in the economic scheme and each was fairly rewarded for its share in production so that there was neither wealth nor poverty to inspire conflict Nobody was allowed to be idle, until the time came for him to retire when he became free to enjoy whatever cultural pleasures he wished, but, since the system was devoid of the waste associated with competition, the working day would be only six hours There was to be compulsory schooling and free medical care for everybody, full religious toleration, complete equality of the sexes, and a modern system of dealing with crime which was free from vindictiveness and cruelty Government was to be simple and direct by democratically-elected officials whose powers would be strictly limited and the public expenditure kept under close scrutiny It will be seen that More was far in advance of his age, and to most democratically-minded people in advance of an earlier utopia, Plato's *Republic*, which is described under the heading of Education.

James Harrington James Harrington published his book *The Commonwealth of Oceana* in 1656 and offered it to Oliver Cromwell for his consideration but without tangible results Better than any other man of his time Harrington understood the nature of the economic revolution which was then taking place, and, like More, saw the private ownership of land as the main cause of conflict He put forward the theory that the control of property, particularly in the shape of land, determines the character of the political structure of the state, if property were universally distributed among the people the sentiment for its protection would naturally result in a republican form of government The Commonwealth of Oceana was a society "of laws and not of men"—*i e*, it was to be legally based and structured so as to be independent of the good or ill-will of any individuals controlling it Thus there must be a written constitution, a two-house legislature, frequent elections with a secret ballot, and separation of powers between legislature and executive—all today familiar features of parliamentary democracy, but unique in his time.

Saint-Simon The utopias of the late 18th and 19th cent come, of course, into the period of the industrial revolution and of laissez-faire capitalism Individual enterprise and complete freedom of competition formed the outlook of the ruling class Naturally the utopias of this period tended to have a strongly socialist tinge since such theories are obviously produced by those who are not satisfied with existing conditions Saint-Simon's *New Christianity* (1825) is one such, and by many, Claude Henri, Comte de Saint-Simon (1760–1825) is regarded as the founder of French socialism. His book urged a dedication of society to the principle of human brotherhood and a community which would be led by men of science motivated by wholly spiritual aims Production property was to be nationalised (or "socialised" as he describes the process) and employed to serve the public good rather than private gain, the worker was to produce according to his capacity and to be rewarded on the basis of individual merit, the principle of inheritance was to be abolished since it denied the principle of reward for accomplishment on which the society was to be founded. Saint-Simon's proposals were not directed towards the poorer classes alone, but to the conscience and intellect of all. He was deeply impressed with the productive power of the new machines and his scheme was, first and foremost, intended as a method of directing that power to the betterment of humanity as a whole

Fourier. Francois Marie Charles Fourier (1772–1837), although by conviction a philosophical anarchist who held that human beings are naturally good if allowed to follow their natural desires, was the originator of what, on the face of it, one would suppose to be the most regimented of the utopias It consisted of a system of "phalanxes" or co-operative communities each composed of a group of workers and technicians assured of a minimum income and sharing the surplus on an equitable basis Agriculture was to be the chief occupation of each phalanx and industrial employment planned and so carefully assigned that work would become pleasant and creative rather than burdensome One of his ideas was that necessary work should receive the highest pay, useful work the next, and pleasant work the least pay. The land was to be scientifically cultivated and natural resources carefully conserved Most of the members' property was to be privately owned, but the ownership of each phalanx was to be widely diffused among members by the sale of shares Such "parasitic and unproductive" occupations as stockbroker, soldier, economist, middle-man and philosopher would be eliminated and the education of children carried out along vocational lines to train them for their future employment

The strange thing was that Fourier's suggestions appealed to many both in Europe and the U S A and such men (admittedly no economic or technical experts) as Emerson, Thoreau, James Russell Lowell, and Nathaniel Hawthorne strongly supported them An American Fourier colony known as Brook Farm was established and carried on for eight years when it was dissolved after a serious fire had destroyed most of its property

Robert Owen Robert Owen (1771–1858), a wealthy textile manufacturer and philanthropist, established communities founded on a kind of utopian socialism in Lanarkshire, Hampshire, and America Of his New Lanark community an American observer wrote "There is not, I apprehend, to be found in any part of the world, a manufacturing community in which so much order, good government, tranquillity, and rational happiness prevail" The workers in Lanark were given better housing and education for their children, and it was administered as a co-operative self-supporting community in Scotland Later in life Owen returned to sponsoring legislation that would remove some of the worst evils of industrial life in those days reduction of the working day to twelve hours, prohibition of labour for children under the age of ten, public schools for elementary education, and so on But he lived to see few of his reforms adopted He also promoted the creation of co-operative societies, the formation of trades unions, labour banks and exchanges the workers' educational movement, and even an Anglo-American federation There can be no doubt that, if he saw little result himself, he left the imprint of his convictions to benefit future communities who may not even know his name

V

Vitalism, the philosophical doctrine that the behaviour of the living organism is, at least in part, due to a vital principle which cannot possibly be explained wholly in terms of physics and chemistry This belief was at one time held strongly by the late Professor C E M Joad and is implicit in Henri Bergson's (1858–1941) theory of creative evolution It was maintained by Bergson that evolution, like the work of an artist, is creative and therefore unpredictable, that a vague need exists beforehand within the animal or plant before the means of satisfying the need develops Thus we might assume that sightless animals developed the need to become aware of objects before they were in physical contact with them and that this ultimately led to the origin of organs of sight Earlier this century a form of vitalism described as "emergent evolution" was put

forward This theory maintains that when two or more simple entities come together there may arise a new property which none of them previously possessed. Today biologists would say that it is the *arrangement* of atoms that counts, different arrangements exhibiting different properties, and that biological organisation is an essentially dynamic affair, involving the lapse of time

W

Wahabis, members of an Arabian sect of Islam which originated in the teaching of Muhammad Ibn 'Abd-al-Wahab, born at the end of the 17th cent He was deeply resentful of the Turkish rule which, in addition to its tyranny, had brought about innovations in the religion which Muhammad regarded as a perversion of its original form He proceeded to reform Islam to its primitive conditions and impressed his beliefs on Mohammed Ibn Saud, a sheikh who spread them with the aid of his sword Under the successors of Ibn Saud the power of the Wahabis spread over much of Arabia where it is dominant today in Saudi Arabia Its particular characteristic is that it refuses to accept symbolic or mystical interpretations of the words of the Prophet and accepts quite literally the teaching of Islam It is, in fact, a sort of Moslem fundamentalism Although crushed by the Turks in 1811–15, the movement remains an important element in Mohammedanism

Waldenses, a movement also known as "The Poor Men of Lyons," founded by Peter Waldo of that city about the same time, and in the same part of southern France, as the Albigenses (*q v*) with whom, however, they had nothing in common Their main belief was a return to Apostolic simplicity, based on reading the Bible in their own language, their doctrines were somewhat similar to those of the Mennonites and the Quakers However, they did not wish to separate themselves from the Church and were originally protected by several popes until the Lateran Council of 1215 excluded them mainly for the crime of preaching without ecclesiastical permission From this time they were subjected to persecution, yet maintained some contact with the Church until the Reformation when they chose to take the side of the Protestants Situated mainly on the sides of the Alps, half in Piedmont and half in France, they were persecuted or not according to the contemporary political convenience of the Dukes of Savoy, and the major attempt to destroy them called forth Oliver Cromwell's intervention and the famous sonnet of Milton In spite of torture, murder, deportation, and even the kidnapping of their children, to have them brought up in the Roman Catholic faith, the sect survived, and still exists, having been granted full equality of rights with his Roman Catholic subjects by Charles Edward of Piedmont in 1848

Witchcraft There are various interpretations and definitions of witchcraft from that of Pennethorne Hughes who states that "witchcraft, as it emerges into European history and literature, represents the old paleolithic fertility cult, plus the magical idea, plus various parodies of contemporary religions" to that of the fanatical Father Montague Summers who says that spiritualism and witchcraft are the same thing The leading authority on witchcraft, however, Dr Margaret Murray, distinguishes between Operative Witchcraft (which is really **Magic** (*q v*)) and Ritual Witchcraft which, she says, "embraces the religious beliefs and ritual of the people known in late mediaeval times as 'witches'" That there were such people we know from history and we know, too, that many of them—the great majority of them women—were tortured or executed or both Since the figures of such executions vary so enormously it would be pointless to quote them, nevertheless they must have been considerable, especially after the promulgation of the bull *Summis Desiderantes* by Pope Innocent VIII in 1484 Dr Murray points out that there have ordinarily been two theories about witchcraft (1) that there were such beings as witches, that they possessed supernatural powers and that the evidence given at their trials was substantially correct, (2) that the witches were simply poor silly creatures who either deluded themselves into believing that they had certain powers or, more frequently, were tortured into admitting things that they did not do She herself accepts a third theory that there were such beings as witches, that they really did what they admitted to doing, but that they did not possess supernatural powers They were in fact believers in the old religion of pre-Christian times and the Church took centuries to root them out What this religion was is not quite certain, but it may have been the remains of the Druidic cult (*q v*) or have had much earlier origins However, that there existed "covens" of witches who carried out peculiar rites Dr Murray has no doubt whatever Pope Innocent VIII who himself was "a man of scandalous life," according to a Catholic historian, appointed in his bull "our dear sons Henry Kramer and James Springer, professors of theology delegated as Inquisitors of these heretical pravities" One of the results was the *Malleus Maleficarum* ("The Hammer of Witches") published by "the dear sons" and used as a text-book of procedure of witchcraft trials

World Council of Churches, a union of Christian Churches from all over the world (including the Churches of the Protestant, Anglican, and Orthodox traditions, but excluding the Roman Catholic Church) engaged in extending Christian mission and unity throughout the world All Churches which "accept our Lord Jesus Christ as God and Saviour" are eligible This modern oecumenical movement stems from the great World Missionary Conference held at Edinburgh in 1910 The World Council was founded in 1948 and meets for consultation from time to time; the third assembly met in New Delhi in 1961, when the Russian Orthodox Church was admitted.

Y

Yoga, a Hindu discipline which teaches a technique for freeing the mind from attachment to the senses, so that once freed the soul may become fused with the universal spirit (*Atman* or *Brahma*), which is its natural goal This is the sole function of the psychological and physical exercises which the Yogi undertakes, although few ever reach the final stage of *Samadhi* or union with *Brahma* which is said to take place in eight levels of attainment These are (1) *Yama*, which involves the extinction of desire and egotism and their replacement by charity and unselfishness, (2) *Niyama* during which certain rules of conduct must be adopted, such as cleanliness, the pursuit of devotional studies, and the carrying out of rituals of purification, (3) *Asana*, or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the "lotus position" familiar from pictures), (4)–(5) *Pranayama*, the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive, the first being complete absorption in the act of breathing which empties the mind of any other thought, the second being the ability almost to cease to breathe which allegedly enables him to achieve marvellous feats of endurance, (6) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense, (7) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM, and perhaps by a kind of self-hypnosis, leads (8) to *Samadhi* the trance state which is a sign of the complete unity of soul with reality

Yoga is very old, and when the sage Patanjali (*c* 300 B C) composed the book containing these instructions, the *Yoga Sutras*, he was probably collecting from many ancient traditions Some of the claims made by Yogis seem, to the Western mind, frankly incredible, but in the West and especially in recent years Yoga methods have been used at the lower levels in order to gain improved self-control, better posture, and improved health. Whether it achieves these ends is another matter, but the genuine Yogi regards this as a perversion of the nature and purpose of the discipline

Z

Zen Buddhism, a Buddhist sect which is believed to have arisen in 6th cent. China but has flourished chiefly in Japan, for some reason it has of recent years begun to attract attention in the West thanks to the voluminous writings of Dr D. T Suzuki and the less numerous but doubtless much-read books of Mr Christmas Humphreys. But the fact that these writings exist does not explain their being read, nor why of all possible Eastern sects this particular one should be chosen in our times What is Zen's attraction and why should anyone take the trouble to read about something (the word "something" is used for reasons that will become evident) that is not a religion, has no doctrine, knows no God and no after-life, no good and no evil, and possesses no scriptures but has to be taught by parables which seem to be purposely meaningless? One of the heroes of Zen is the fierce-looking Indian monk Boddhidharma (fl. c 516–534) who brought Buddhism to China, of whom it is recounted that when the Emperor asked him how much merit he had acquired by supporting the new creed, the monk shouted at him "None whatever!" The Emperor then wished to know what was the sacred doctrine of the creed, and again the monk shouted "It is empty—there is nothing sacred!" Dr Suzuki, having affirmed that there is no God in Zen, goes on to state that this does not mean that Zen denies the existence of God because "neither denial nor affirmation concerns Zen" The most concrete statement he is prepared to make is that the basic idea of Zen is to come in touch with the inner workings of our being, and to do this in the most direct way possible without resorting to anything external or superadded Therefore anything that has the semblance of an external authority is rejected by Zen Absolute faith is placed in a man's own inner being Apparently the intention is that, so far from indulging in inward meditations or such practices as the Yogi uses, the student must learn to act spontaneously, without thinking, and without self-consciousness or hesitation This is the main purpose of the *koan*, the logically insoluble riddle which the pupil must try to solve One such is the question put by master to pupil "A girl is walking down the street, is she the younger or the older sister?" The correct answer, it seems, is to say nothing but put on a mincing gait, to *become* the girl, thus showing that what matters is the experience of being and not its verbal description Another *koan* "What is the Buddha?" "Three pounds of flax" is attributed to Tung-shan in the 9th cent and a later authority's comment is that "none can excel it as regards its irrationality which cuts off all passages to speculation" Zen, in effect, teaches the uselessness of trying to use words to discuss the Absolute

Zen came to Japan in the 13th cent, more than five centuries after Confucianism or the orthodox forms of Buddhism, and immediately gained acceptance whilst becoming typically Japanese in the process One of the reasons why it appealed must have been that its spontaneity and insistence on action without thought, its emphasis on the uselessness of mere words, and such categories as logical opposites, had an inevitable attraction for a people given to seriousness, formality, and logic to a degree which was almost stifling Zen must have been to the Japanese what nonsense rhymes and nonsense books, like those of Edward Lear and Lewis Carroll, were to the English intellectuals. Lear's limericks, like some of the *koans*, end up with a line which, just at the time when one expects a point to be made, has no particular point at all, and *Alice in Wonderland* is the perfect example of a world, not without logic, but with a crazy logic of its own which has no relationship to that of everyday life Therefore Zen began to impregnate every aspect of life in Japan, and one of the results of its emphasis on spontaneous action rather than reason was its acceptance by the Samurai, the ferocious warrior class, in such activities as swordsmanship, archery, Japanese wrestling, and later Judo and the Kamikaze dive-bombers But much of Japanese art, especially landscape gardening and flower-arrangement, was influenced similarly, and Zen is even used in Japanese psychiatry The very strict life of the Zen monks is based largely on doing things, learning through experience, the periods of meditation in the Zendo hall are punctuated by sharp slaps on the face administered by the abbot to those who are unsatisfactory pupils Dr. Suzuki denies that Zen is nihilistic, but it is probably its appearance of nihilism and its appeal to the irrational and spontaneous which attracts the Western world at a time when to many the world seems without meaning and life over-regimented However, it has influenced such various aspects of Western life as philosophy (Heidegger), psychiatry (Erich Fromm and Hubert Benoit), writing (Aldous Huxley), and painting (Die Zen Gruppe in Germany)

Zionism, a belief in the need to establish an autonomous Jewish home in Palestine which, in its modern form, began with Theodor Herzl (1860–1904), a Hungarian journalist working in Vienna Although Herzl was a more or less assimilated Jew, he was forced by the Dreyfus case and the pogroms in Eastern Europe to conclude that there was no real safety for the Jewish people until they had a state of their own The Jews, of course, had always in a religious sense thought of Palestine as a spiritual homeland and prayed "next year in Jerusalem," but the religious had thought of this in a philosophical way as affirming old loyalties, not as recommending the formation of an actual state Therefore Herzl was opposed both by many of the religious Jews and, at the other extreme, by those who felt themselves to be assimilated and in many cases without religious faith Even after the Balfour Declaration of 1917, there was not a considerable flow of Jews to Palestine, which at that time was a predominantly Arab state But the persecutions of Hitler changed all this and, after bitter struggles, the Jewish state was proclaimed in 1948 Today Zionism is supported by the vast majority of the Jewish communities everywhere (although strongly disapproved of in the Soviet Union as "Western imperialism") and Zionism is now an active international force concerned with protecting the welfare and extending the influence of Israel

Zoroastrianism, at one time one of the great world religions, competing in the 2nd cent A D on almost equal terms from its Persian home with Hellenism and the Roman Imperial Government Under the Achaemenidae (c 550–330 B C) Zoroastrianism was the state religion of Persia Alexander's conquest in 331 B C brought disruption but the religion flourished again under the Sassanian dynasty (A D c 226–640) With the advance of the Mohammedan Arabs in the 7th cent Zoroastrianism finally gave way to Islam A number of devotees fled to India there to become the Parsees In Persia itself a few scattered societies remain

The name Zoroaster is the Greek rendering of Zarathustra, the prophet who came to purify the ancient religion of Persia It is thought that he lived at the beginning of the 6th cent B C He never claimed for himself divine powers but was given them by his followers The basis of Zoroastrianism is the age-long war between good and evil, Ahura Mazda heading the good spirits and Ahriman the evil ones. Morality is very important since by doing right the worshipper is supporting Ahura Mazda against Ahriman, and the evil-doers will be punished in the last days when Ahura Mazda wins his inevitable victory.

The sacred book of this religion is the *Avesta* If Zoroastrianism has little authority today, it had a very considerable influence in the past Its doctrines penetrated into Judaism (*q v*) and, through Gnosticism, Christianity. The worship of Mithra by the Romans was an impure version of Zoroastrianism Manichaeism (*q v*) was a Zoroastrian heresy and the Albigensianism of mediaeval times was the last relic of a belief which had impressed itself deeply in the minds of men.

Gazetteer of the World

Gazetteer of the World

This edition of the gazetteer has been revised from standard and authoritative sources. For the population figures the latest censuses have been used, where available, and where not available, the latest official estimates.

An endeavour has been made to include all the more important places throughout the world. The small scale of the maps included in the Cyclopædia does not enable all places included in the gazetteer to be named on the maps.

In regard to the spelling of place names, the general principle followed has been to adopt national spellings. For those countries where the Latin Alphabet is not used, the principles for transliteration laid down by the "Permanent Committee on Geographical Names" of the Royal Geographical Society have been followed. There may be a few instances where the spelling shown on the map does not conform to that used in the gazetteer.

ABBREVIATIONS USED IN THE GAZETTEER

Geographical Names

Ala. = Alabama
Ark. = Arkansas
A S S R = Autonomous Soviet Socialist Republic
Atl Oc = Atlantic Ocean
B C = British Columbia
Brit. = British

Abrantes, *t*, Portugal, on the Tagus R; French won battle here in Napoleonic Wars, 1807; p (1940) *11,339*
Abruzzi and Molise, *region* of Italy on the Adriatic, inc provs of Aquila, Chieti, and Campobasso, Teramo, a 5,883 sq m, p (1951) *1,682,808*
Abu, *mtn*, Gujarat, India, 5,653 ft, Jain temples
Abukir or Aboukir, *vil* on Abukir Bay, Egypt, site of ancient Canopus, Battle of the Nile fought in the Bay, 1798, p *7,086*
Abu Simbel, Nile Valley, Egypt, famous anc temples carved out of solid sandstone, one to Rameses II and the other to his Queen, rescue operation from rising waters behind Aswan High Dam under consideration
Abydos, *ruined c* Upper Egypt, celebrated for its temple of Osiris
Abydos, *ruined castled t*, Anatolia on the Dardanelles, which desperately resisted Philip of Macedon, and famous for the love story of Leander and Hero
Abyssinia, *see* **Ethiopia**
Acadia or Acadie, French name applied to previous possessions S of St Lawrence R, inc Nova Scotia and New Brunswick and part of Maine
Acajutla, *spt.*, Salvador, Central America, coffee
Acambaro, *t*, Mexico, rly junction, p *17,643*
Acapulco, *spt*, Pacific coast Mexico, exp hides, cedar, fruit, p *9,993*
Acatlán de Osorio, *t*, Puebla st central Mexico, p *5,591*.
Acayucán, *t* Veracruz st, Mexico; p *5,143*
Accra, *spt*, *cap* Ghana, W Africa, univ, airport; p (1960) *491,060* (inc cap dist and rural a)
Accrington, *mun bor*, *mftg t*, Lancs, Eng, 20 m N of Manchester, cotton ctr, coal, textile machin, engin, bricks, p (1961) *40,987*
Acerra, *t*, S Italy, destroyed by Hannibal 216 B C, restored 210 B C, olive oil, wine, hemp; p. *16,460*.
Achaia, *prov*, Greece; a 2,000 sq m; with Elis prov chief currant-producing dist, spt., Patras, p (1951) *228,274*.
Achill, *I*, off the W. coast of Mayo, Ireland, agric, fishing.
Achill Head, *cape*, Mayo
Acireale, *spt.*, Sicily, sulphur baths; p *36,871*
Acklin, *island*, Bahamas, W Indies; timber, sponges; p. (1953) *1,273*.
Acomita, *vil*, N.M., U S.A.; on Acoma Indian Reservation, pottery mkg, p (1948) *1,182*.

Aconcagua, *mtn.*, Andes, Argentine, S. America, highest peak of New World, alt 22,835 ft

Aconcagua, *prov.*, Chile; a 3,939 sq m.; cap San Felipe, alfalfa and Mediterranean fruits, p (1957) *154,075*

Aconquija, Sierra de, *mtn. range*, N Argentina, S America, rises steeply from Chaco lowland to 18,000 ft.

Acqui, *ancient walled t.*, N Italy, prov. Alessandria; famous cath., sulphur springs, p. *18,975*

Acre (Akka), *c., spt.*, Israel, famous for its sieges during Crusades and in 1799 withstanding Napoleon for 61 days, p *14,000*

Acre, *terr.*, Brazil; a 59,139 sq m, cap Rio Branco, rubber, p (1950) *116,124*

Acton, *mun bor*, Middlesex, Eng.; residtl and mftg suburb of London, p. (1961) *65,274*

Ada, *t*, Oklahoma, U S A, p (1960) *14,347*

Adamawa, *prov*, W Africa, divided between Nigeria and Cameroun; a 70,000 sq. m, ivory, groundnuts

Adams, *mftg t* Mass, U S A, paper, cottons, woollens, calcium quarrying; p (1960) *11,919*

Adam's Bridge, ridge of sand and coral reef, 30 m, between India and Ceylon. Proposed inter-dominion rly

Adam's Peak, *sacred mtn.*, S Ceylon, alt 7,352 ft

Adana, *t*, Turkey, on R Seihan; wool, cotton, grain, tobacco, p (1960) *230,024*

Adapazari, *t*, Turkey, rly junction; agr and tr ctr, silk, linen, p (1960) *80,160*.

Adda, *R*, N Italy, flows through L. Como to R Po

Addis Ababa, *cap* Ethiopia; terminus of Jibuti rly.; p (estd 1953) *340,000*

Adelaide, *c., spt., cap.*, S Australia; on R Torrens, which flows into G. of St. Vincent, transcontinental rly connections and inds using wool, leather, iron; imports fuels, fertilisers, exports wheat, wool, wine ores, Univ, p (with suburbs) (1961) *587,656*

Adelboden, *t* Bern can, Switzerland, 19 m S W of Interlaken, health resort, mineral springs.

Adélie Land, Antarctica; French terr, and dependency of Réunion.

Adelsburg, *t*, Jugoslavia, 20 m N.E of Trieste, extensive grotto and stalactite cavern
